Vector Space

- Set of all vectors.

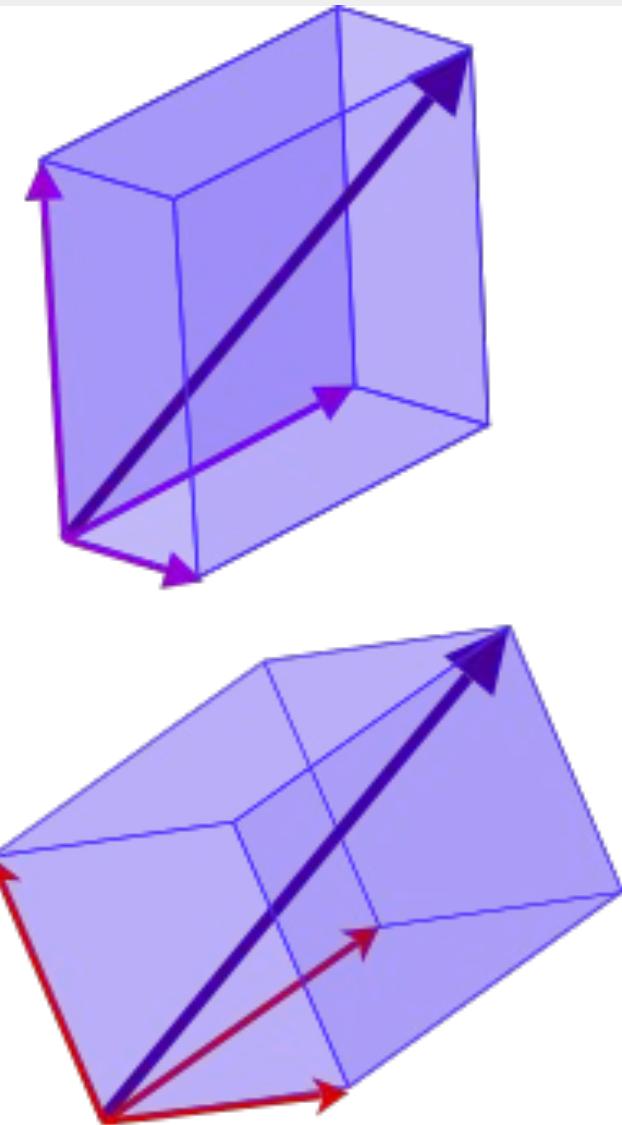

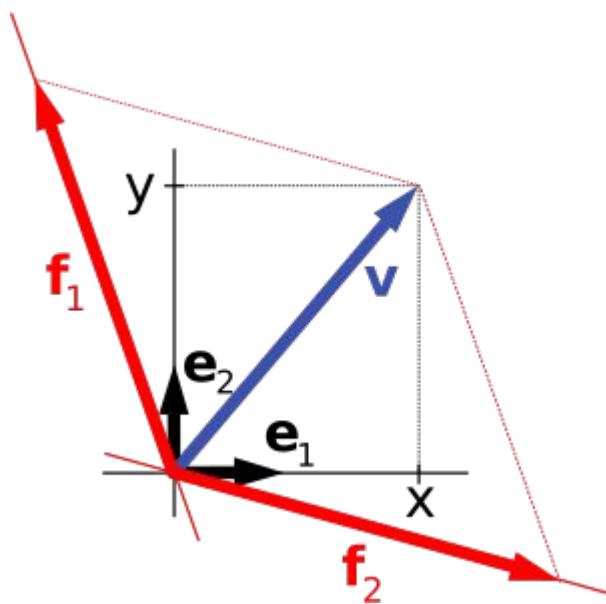

So what are vectors actually?

Something that may be **added together** and **multiplied** ("scaled") by numbers called scalars

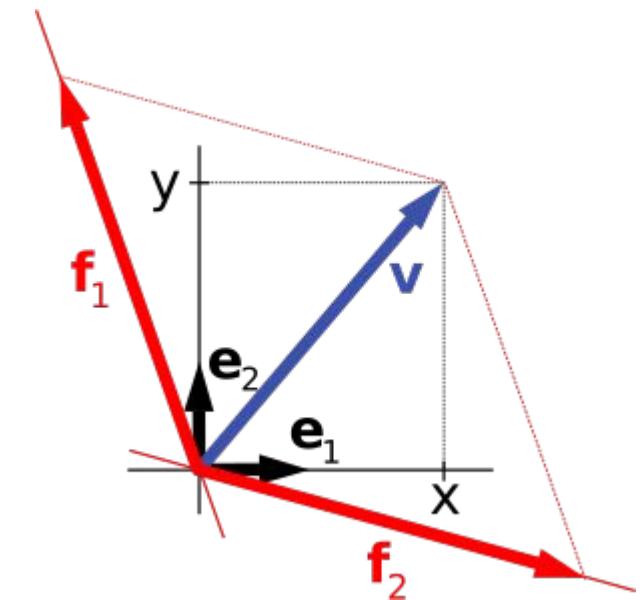

Vector Space

- What is basis?
- Coordinate System?

Vector Space

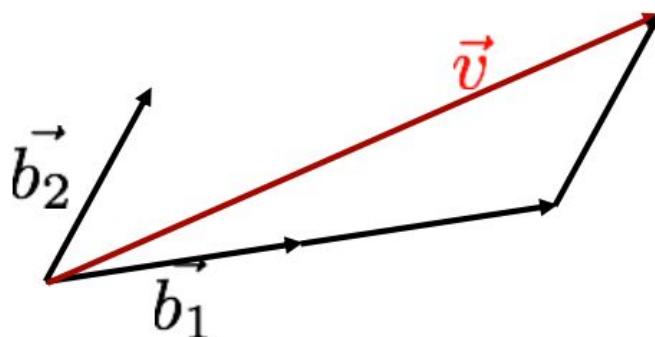

- Set B of vectors in the vector space, that can **uniquely** represent each vector in the vector space as linear combination.
- Linearly independent.
- Coordinate the coefficients of the basis vectors to get to that point.

Vector Space

- Given n basis vectors \vec{b}_i any vector \vec{v} can be written as

$$\vec{v} = \sum_i c_i \vec{b}_i$$

here:

$$\vec{v} = 2\vec{b}_1 + \vec{b}_2$$

Vector Space

$$\vec{v} = c_1 \vec{b}_1 + c_2 \vec{b}_2 + c_3 \vec{b}_3$$

- can be written as

$$\begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \vec{b}_3 \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

Transformation Background

What is Transformation ?

What is a Transformation

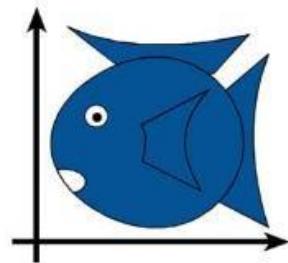

- ★ Transformation:
 - An operation that changes one configuration into another
- ★ For images, shapes, *etc.*
 - A geometric transformation maps positions that define the object to other positions
 - Linear transformation means the transformation is defined by a linear function... which is what matrices are good for.

What is a Transformation?

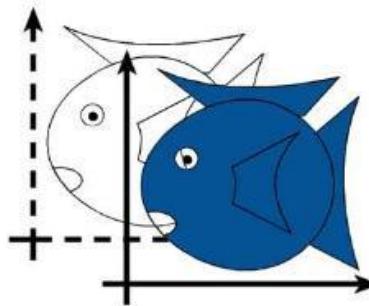

- ★ A function that maps points x to points x' :
Applications: animation, deformation, viewing,
projection, real-time shadows, ...

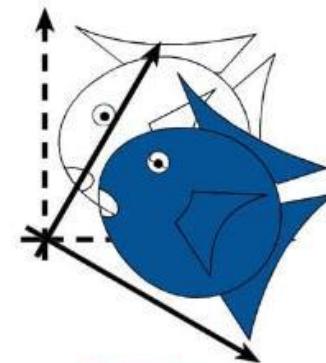

Examples of Transformation

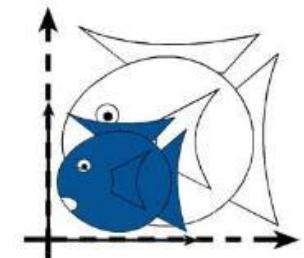

Identity

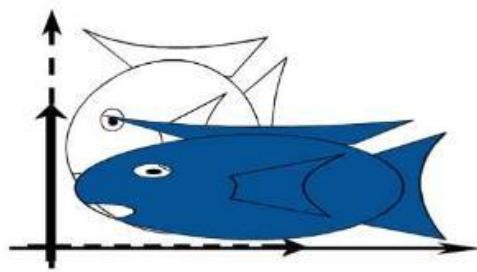

Translation

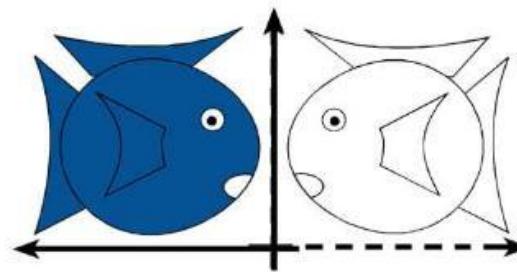

Rotation

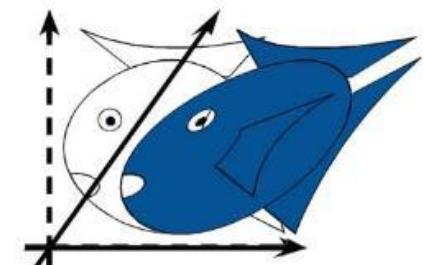

Isotropic
(Uniform)
Scaling

Scaling

Reflection

Shear

Visualization

https://youtu.be/AheaTd_l5ls?si=rVFf7eGMnl1Uujt6

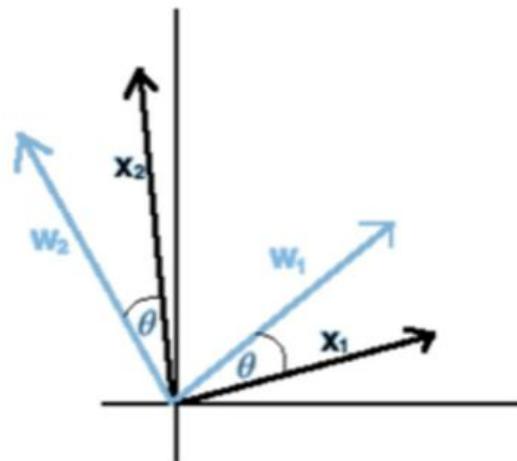

Linear Transformations

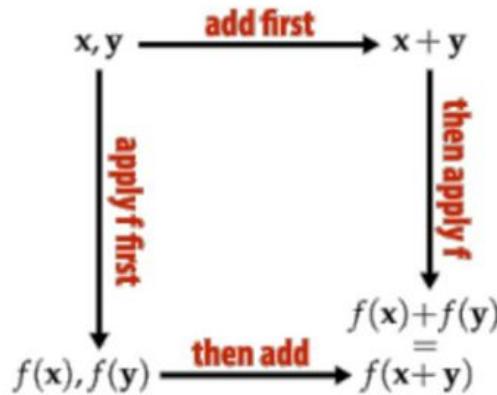

We feel sorry for translation

Linear Transformation

What does it mean for a map $f: \mathbb{R}^n \rightarrow \mathbb{R}^n$ to be linear?

Geometrically it maps lines to lines,
and preserves the origin

Algebraically it preserves vector space operations
(addition & scaling)

Linear Transformation

Transformation \mathcal{L} of the vector space so that

$$\mathcal{L}(\vec{v} + \vec{u}) = \mathcal{L}(\vec{v}) + \mathcal{L}(\vec{u})$$

$$\mathcal{L}(\alpha\vec{v}) = \alpha\mathcal{L}(\vec{v})$$

$$\mathcal{L}(\vec{v}) = \mathcal{L}\left(\sum_i c_i \vec{b}_i\right) = ?$$

Transformation of a vector is just only transformation of basis

$$\begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \vec{b}_3 \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \Rightarrow \begin{bmatrix} \mathcal{L}(\vec{b}_1) & \mathcal{L}(\vec{b}_2) & \mathcal{L}(\vec{b}_3) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

The new basis also exists in vector space.
Can be expressed by combination of previous basis.

$$\mathcal{L}(\vec{b}_1) = \begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \vec{b}_3 \end{bmatrix} \begin{bmatrix} M_{1,1} \\ M_{2,1} \\ M_{3,1} \end{bmatrix}$$

$$\begin{bmatrix} \mathcal{L}(\vec{b}_1) & \mathcal{L}(\vec{b}_2) & \mathcal{L}(\vec{b}_3) \end{bmatrix} = \begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \vec{b}_3 \end{bmatrix} \begin{bmatrix} M_{1,1} & M_{1,2} & M_{1,3} \\ M_{2,1} & M_{2,2} & M_{2,3} \\ M_{3,1} & M_{3,2} & M_{3,3} \end{bmatrix}$$

$$L(c) = Ac = BMc = (BM)c = B(Mc)$$

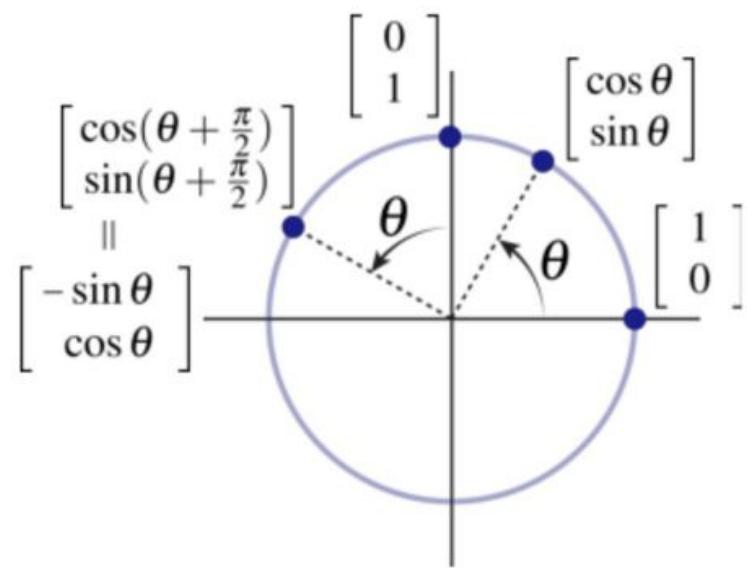

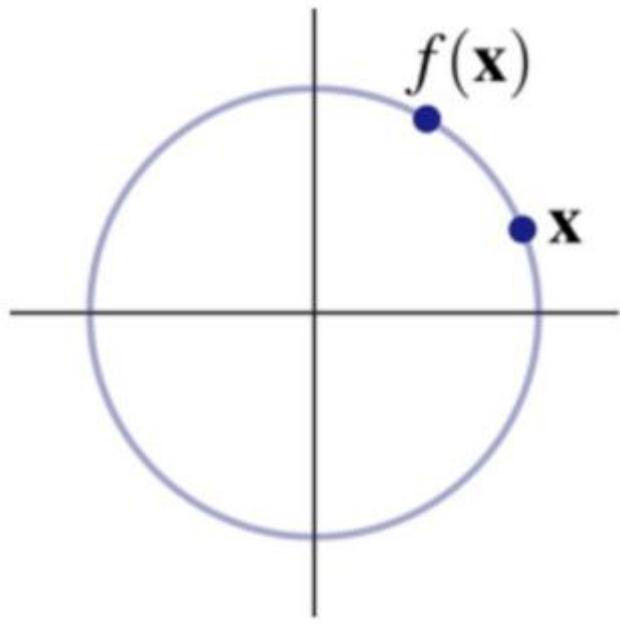

Invariants of Transformation

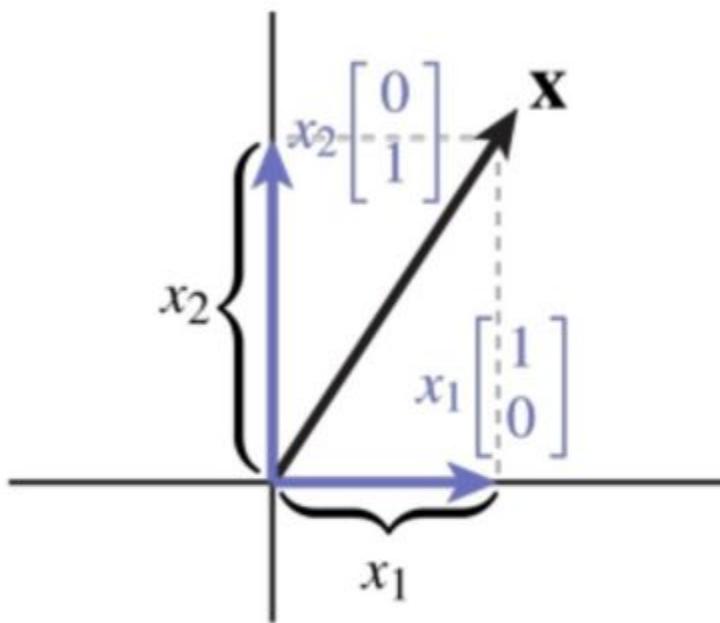

A transformation is determined by the **invariants** it preserves

transformation	invariants	algebraic description
linear	<i>straight lines / origin</i>	$f(a\mathbf{x}+\mathbf{y}) = af(\mathbf{x}) + f(\mathbf{y}),$ $f(0) = 0$
translation	<i>differences between pairs of points</i>	$f(\mathbf{x}-\mathbf{y}) = \mathbf{x}-\mathbf{y}$
scaling	<i>lines through the origin / direction of vectors</i>	$f(\mathbf{x})/ f(\mathbf{x}) = \mathbf{x}/ \mathbf{x} $
rotation	<i>origin / distances between points / orientation</i>	$ f(\mathbf{x})-f(\mathbf{y}) = \mathbf{x}-\mathbf{y} ,$ $\det(f) > 0$
...

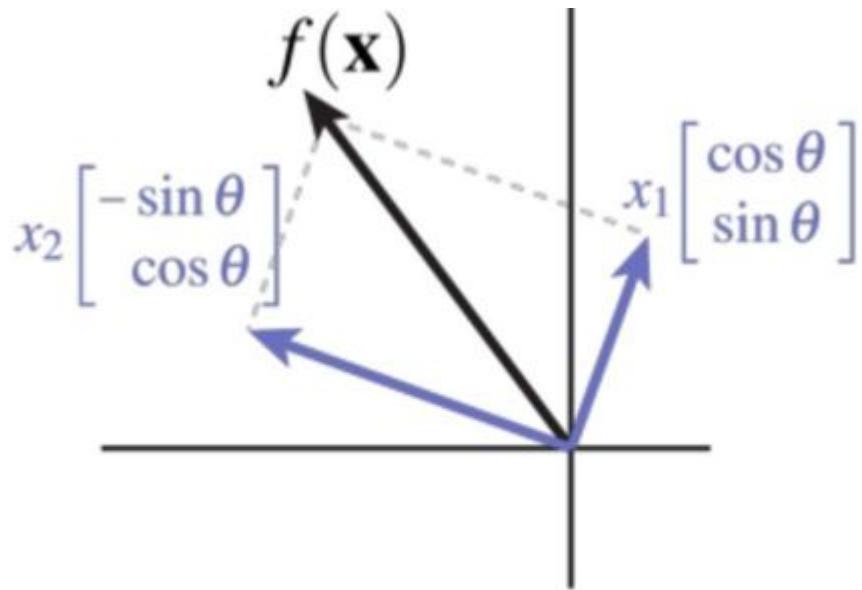

Our Friend Rotation

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$f(\mathbf{x}) = x_1 \begin{bmatrix} \cos \theta \\ \sin \theta \end{bmatrix} + x_2 \begin{bmatrix} -\sin \theta \\ \cos \theta \end{bmatrix}$$

We expressed Rotation as change of basis.

$$f_\theta(\mathbf{x}) = \begin{bmatrix} \cos \theta & -\sin(\theta) \\ \sin \theta & \cos(\theta) \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

Rotation w.r.t principle axis

In 3D, keep one axis fixed and rotate the other two:

[rotate around x_1]

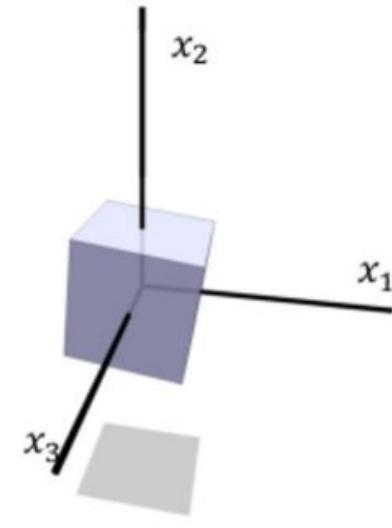

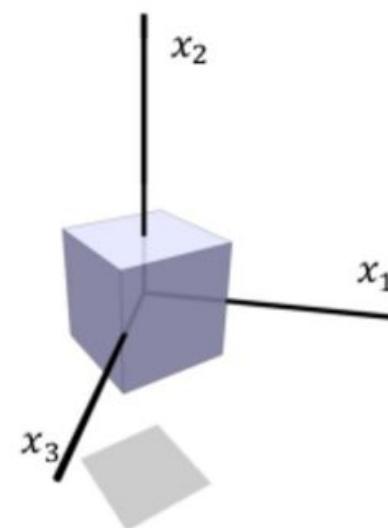

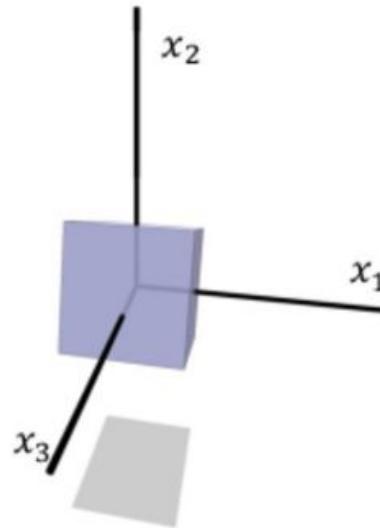

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \theta & -\sin(\theta) \\ 0 & \sin \theta & \cos(\theta) \end{bmatrix}$$

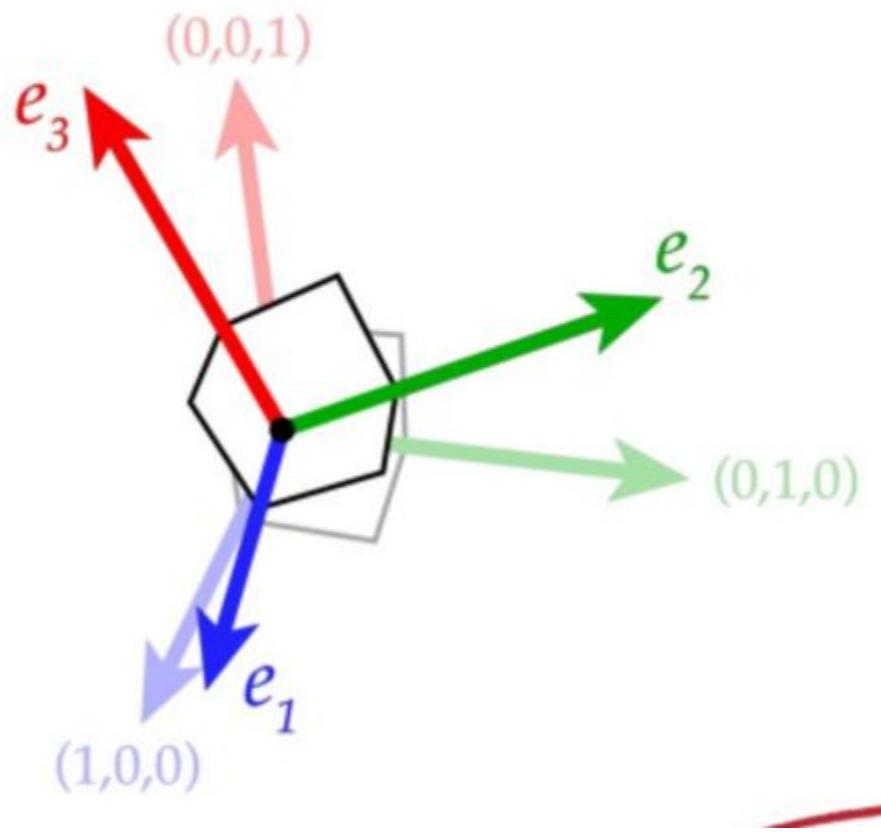

[rotate around x_2]

$$\begin{bmatrix} \cos \theta & 0 & \sin(\theta) \\ 0 & 1 & 0 \\ -\sin \theta & 0 & \cos(\theta) \end{bmatrix}$$

[rotate around x_3]

$$\begin{bmatrix} \cos \theta & -\sin(\theta) & 0 \\ \sin \theta & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$R = \begin{bmatrix} e_1 & e_2 & e_3 \end{bmatrix}$$

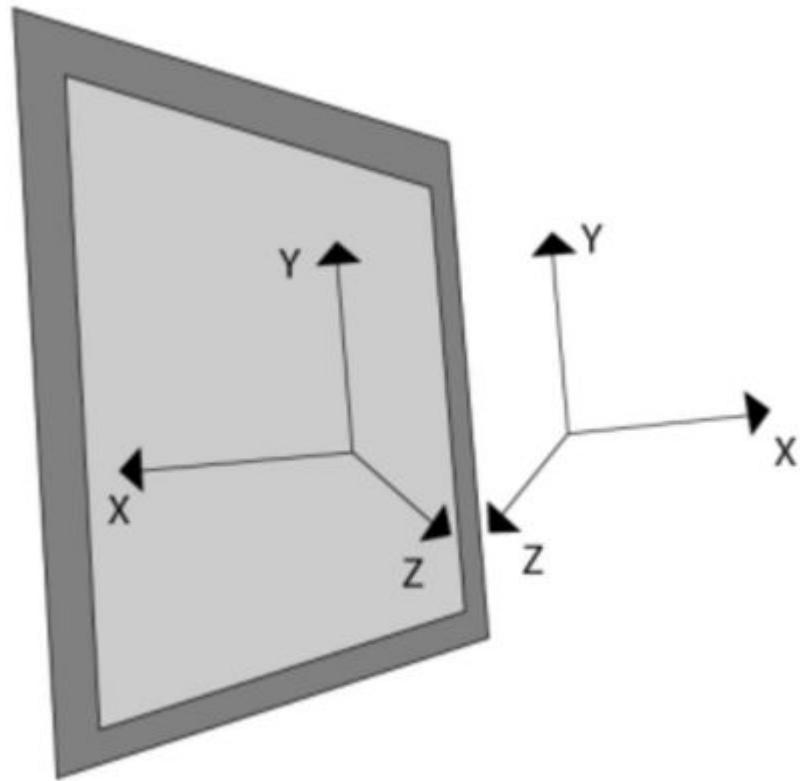

Other Linear Transformations

Reflection

Reflection about y axis

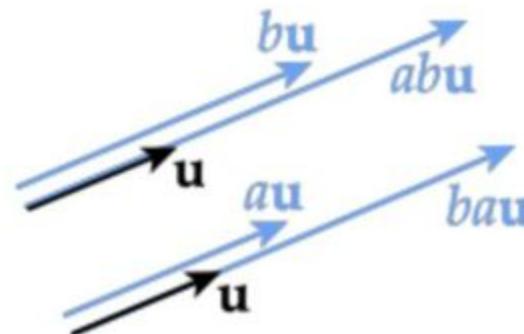

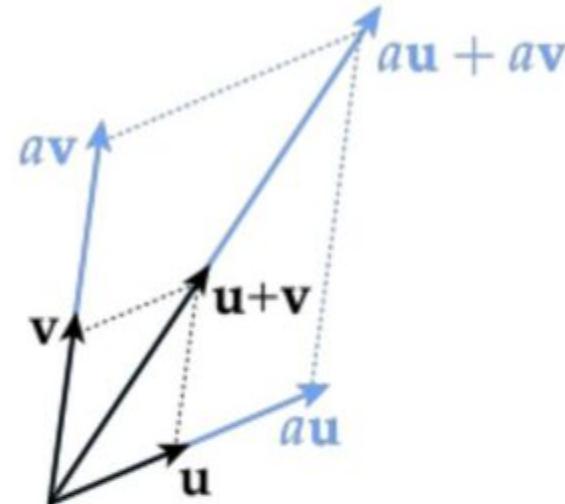

$$Q = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$$

Scaling

Food for thought.
What if a is negative?

Series of reflection

Shear

- A shear displaces each point x in a direction u according to its distance along a fixed vector v :

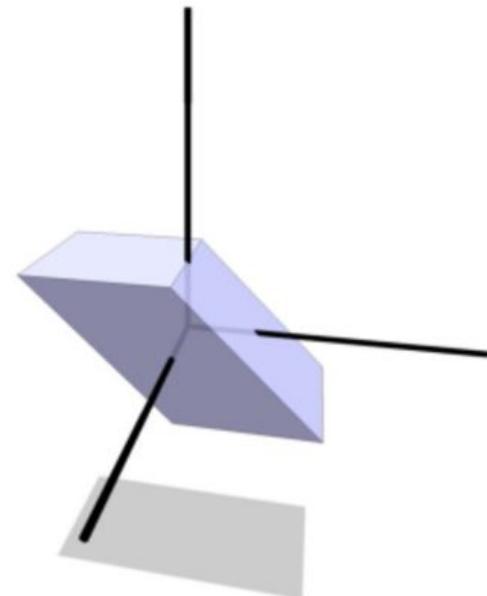

$$f_{\mathbf{u}, \mathbf{v}}(\mathbf{x}) = \mathbf{x} + \langle \mathbf{v}, \mathbf{x} \rangle \mathbf{u}$$

- Still a linear transformation—can be rewritten as:

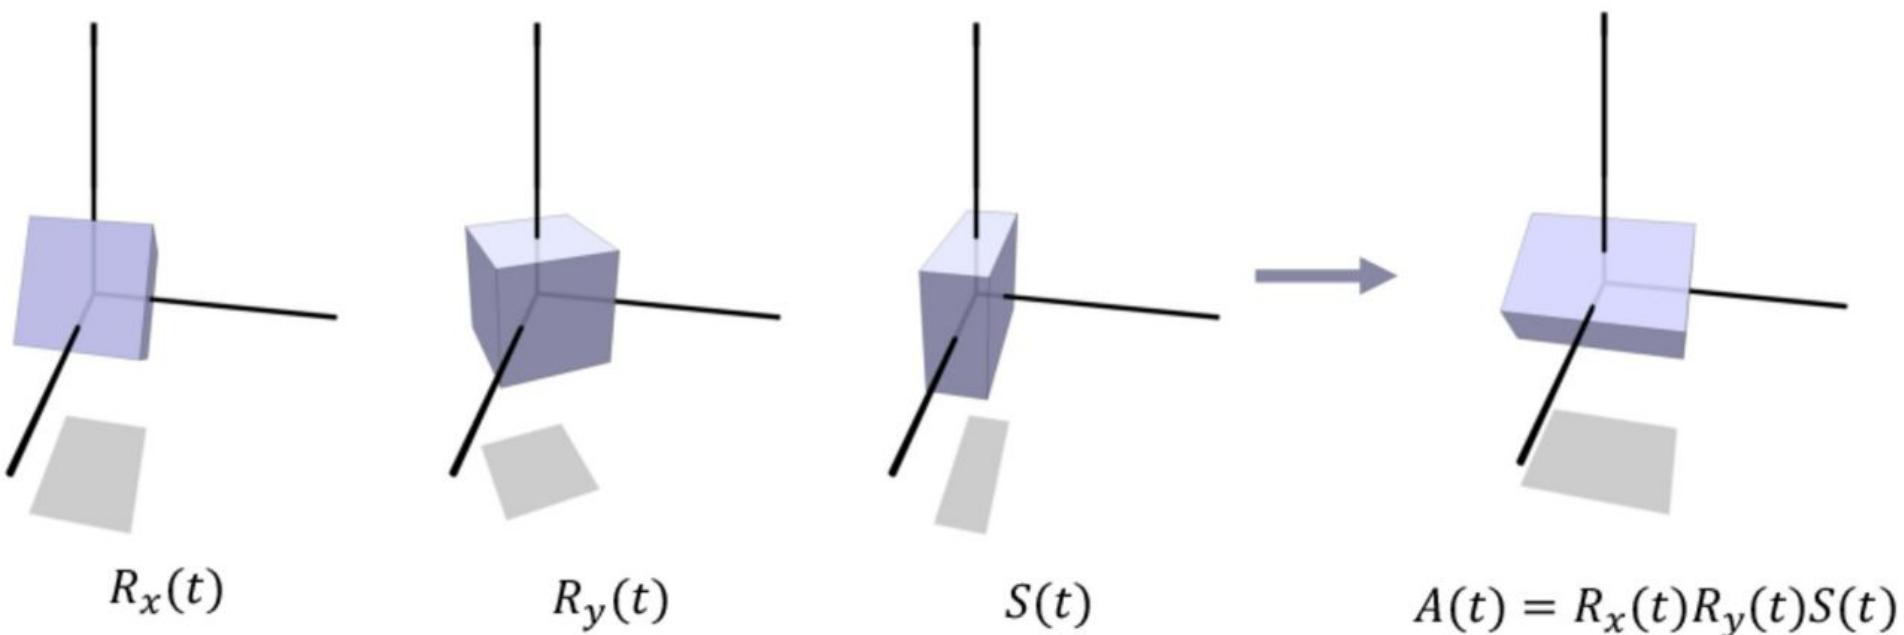

$$A_{\mathbf{u}, \mathbf{v}} = I + \mathbf{u}\mathbf{v}^T$$

- Example:

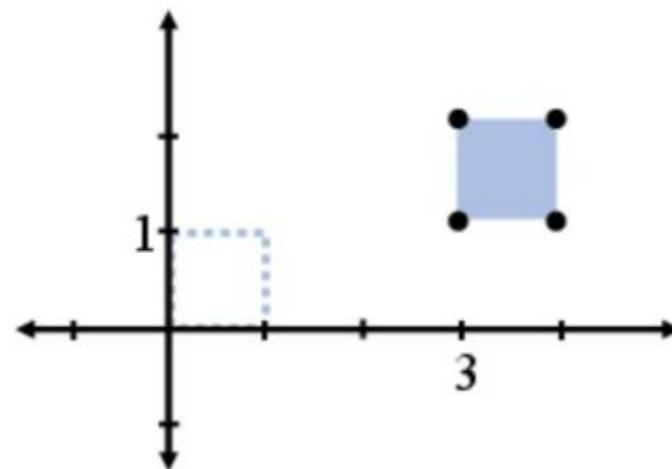

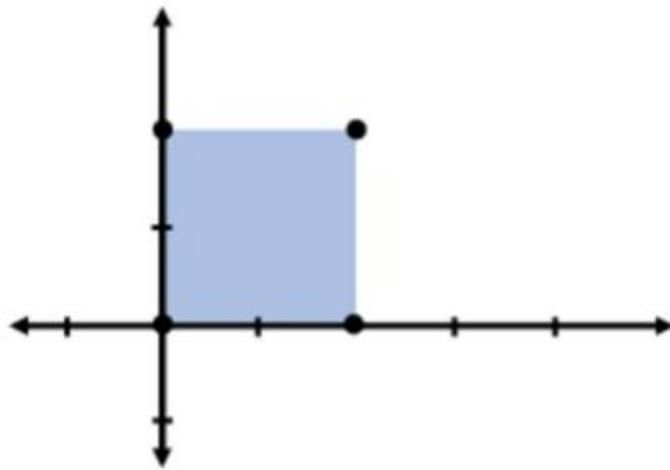

$$\begin{aligned}\mathbf{u} &= (\cos(t), 0, 0) \\ \mathbf{v} &= (0, 1, 0) \quad A_{\mathbf{u}, \mathbf{v}} = \begin{bmatrix} 1 & \cos(t) & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\end{aligned}$$

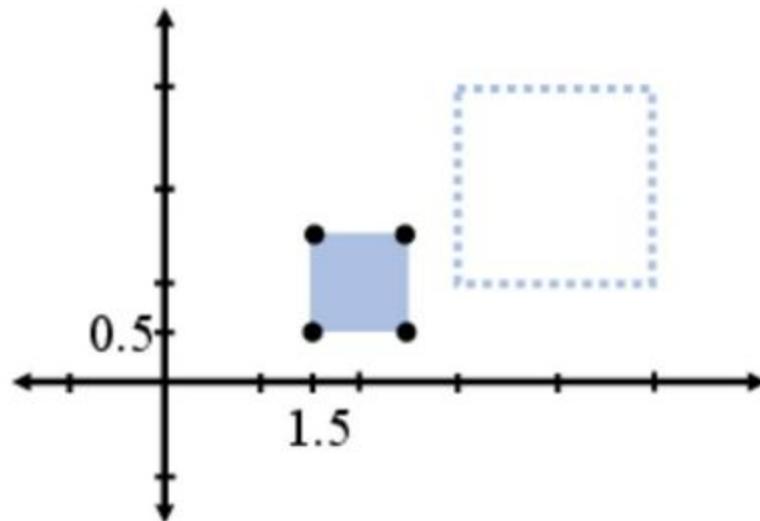

Composite Transformations

Order matters in composite transformation

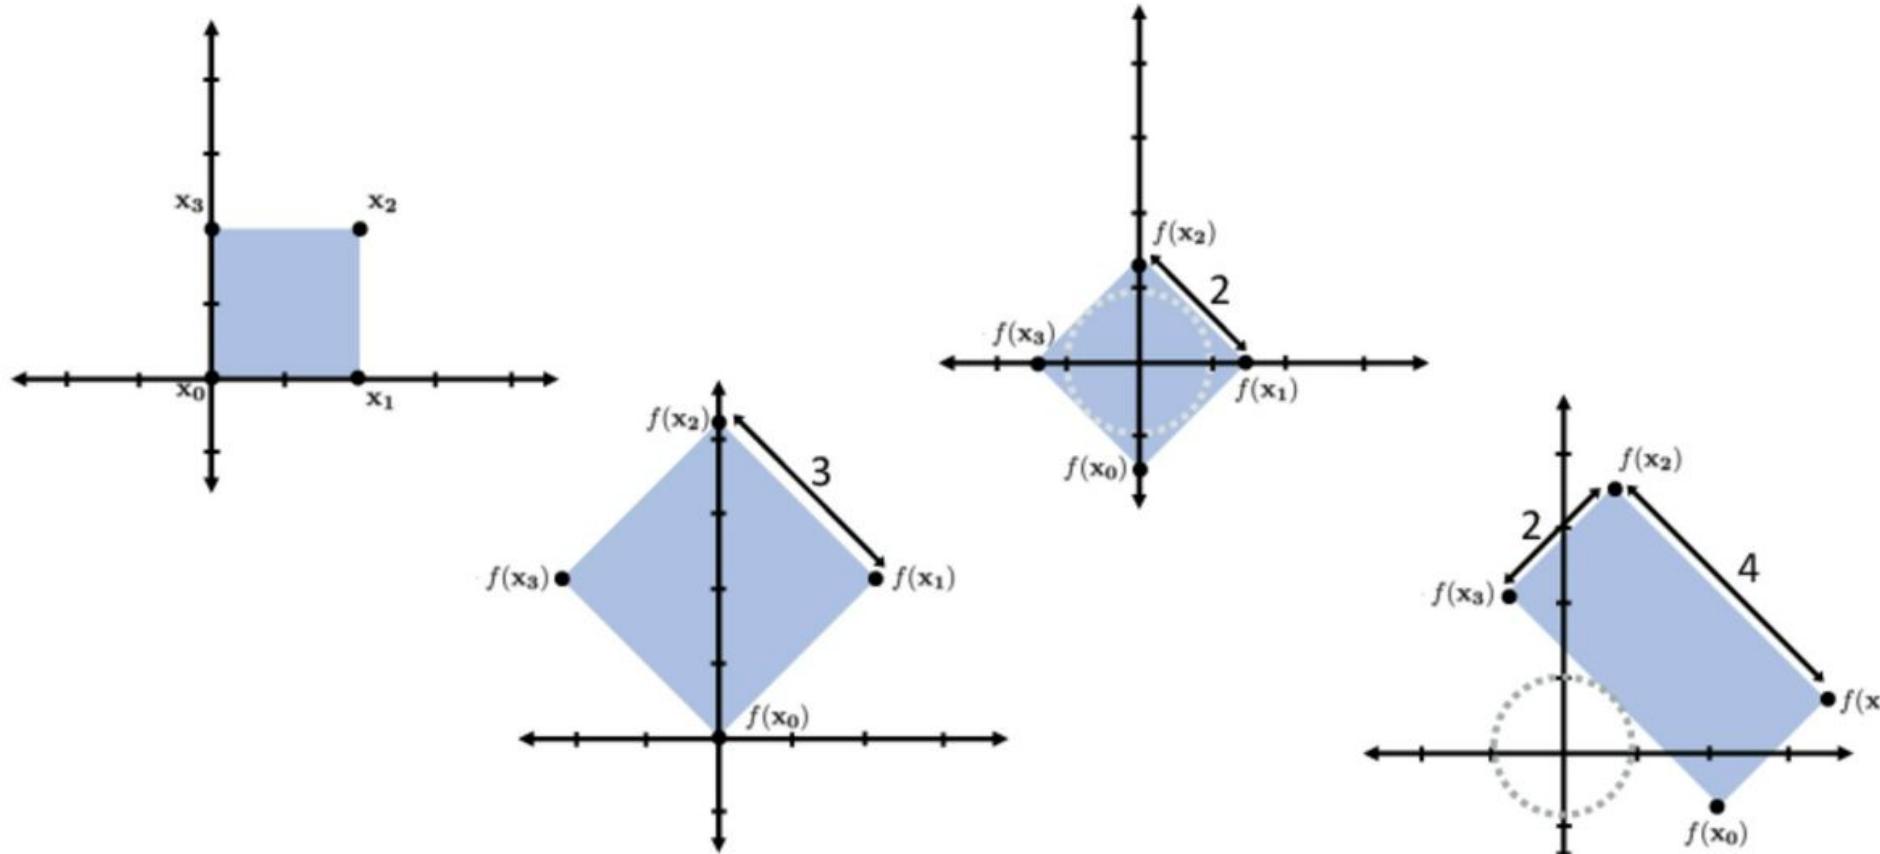

[scale by $1/2$, then translate by $(3, 1)$]

[translate by $(3, 1)$, then scale by $1/2$]

Question for CT

We missed you
Translation

Translation is not linear map

$$f_{\mathbf{u}}(\mathbf{x}) = \mathbf{x} + \mathbf{u}$$

Transformation \mathcal{L} of the vector space so that

$$\mathcal{L}(\vec{v} + \vec{u}) = \mathcal{L}(\vec{v}) + \mathcal{L}(\vec{u})$$

$$\mathcal{L}(\alpha \vec{v}) = \alpha \mathcal{L}(\vec{v})$$

Affine Space

- Presents point (not vector).
 - A frame is a origin + basis.
-
- We can obtain any point in the space by adding a vector to the origin

$$\tilde{p} = \tilde{o} + \sum_i c_i \vec{b}_i$$

Affine Space

$$\begin{bmatrix} \vec{b}_1 & \vec{b}_2 & \vec{b}_3 & \tilde{o} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \\ 1 \end{bmatrix}$$

Translation

$$\tilde{p} \Rightarrow \tilde{p} + \vec{t}$$

$$\begin{bmatrix} \vec{b_1} & \vec{b_2} & \vec{b_3} & \tilde{o} \end{bmatrix} \begin{bmatrix} M_{11} & M_{12} & M_{13} & 0 \\ M_{21} & M_{22} & M_{23} & 0 \\ M_{31} & M_{32} & M_{33} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \\ 1 \end{bmatrix}$$

$$\vec{t} = \begin{bmatrix} \vec{b_1} & \vec{b_2} & \vec{b_3} \end{bmatrix} \begin{bmatrix} M_{14} \\ M_{24} \\ M_{34} \end{bmatrix}$$

Translation

$$\begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

[point in 3D]

Matrix representations of 3D linear transformations just get
an additional identity row/column:

$$\begin{bmatrix} \cos \theta & 0 & \sin \theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin \theta & 0 & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & s & 0 \\ 0 & 1 & t & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & 0 & 0 & 0 \\ 0 & b & 0 & 0 \\ 0 & 0 & c & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & u \\ 0 & 1 & 0 & v \\ 0 & 0 & 1 & w \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

[rotate around y by θ]

[shear by z in (s,t) direction]

[scale by a,b,c]

[translate by (u,v,w)]

How are Transforms Represented?

$$x' = ax + by + c$$

$$y' = dx + ey + f$$

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} a & b \\ d & e \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} c \\ f \end{pmatrix}$$

$$p' = \color{red}{M} p + \color{red}{t}$$

Translation in homogenous coordinates

$$x' = ax + by + c$$

$$y' = dx + ey + f$$

Cartesian formulation

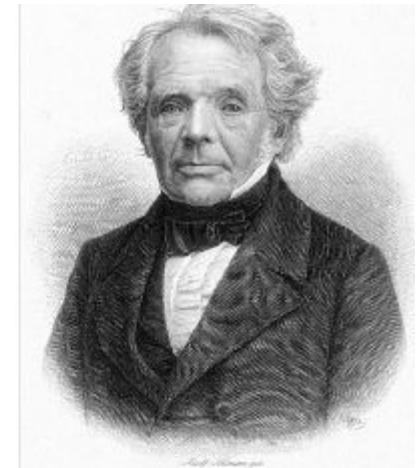

Homogeneous formulation

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ d & e \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} + \begin{bmatrix} c \\ f \end{bmatrix} \quad \middle| \quad \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$
$$p' = Mp + t \quad \middle| \quad p' = Mp$$

Homogeneous Co-ordinates

- * Introduced by **August Ferdinand Möbius**
- * In *Der Barycentrische Calcul* (1827)

August Ferdinand Möbius was a German mathematician and theoretical astronomer.

Homogeneous Co-ordinates

- ★ Translation, scaling and rotation are expressed (non-homogeneously) as:
 - translation: $P' = P + T$
 - Scale: $P' = S \cdot P$
 - Rotate: $P' = R \cdot P$
- ★ Composition is difficult to express, since translation not expressed as a matrix multiplication
- ★ Homogeneous coordinates allow all three to be expressed homogeneously, using multiplication by 3×3 matrices
- ★ W is 1 for affine transformations in graphics

Homogeneous Coordinates

- ★ Add an extra dimension
 - in 2D, we use 3 x 3 matrices
 - In 3D, we use 4 x 4 matrices

- ★ Each point has an extra value, w

$$\begin{pmatrix} x' \\ y' \\ z' \\ w' \end{pmatrix} = \begin{pmatrix} a & b & c & d \\ e & f & g & h \\ i & j & k & l \\ m & n & o & p \end{pmatrix} \begin{pmatrix} x \\ y \\ z \\ w \end{pmatrix}$$

$$p' = \color{red}{M} p$$

Homogeneous Coordinates

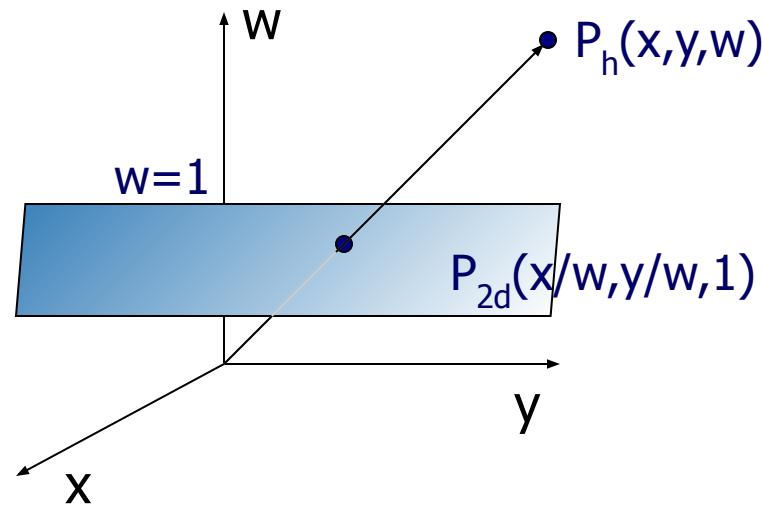

- ★ Most of the time $w = 1$, and we can ignore it

$$\begin{pmatrix} x' \\ y' \\ z' \\ 1 \end{pmatrix} = \begin{pmatrix} a & b & c & d \\ e & f & g & h \\ i & j & k & l \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}$$

- ★ If we multiply a homogeneous coordinate by an *affine matrix*, w is unchanged

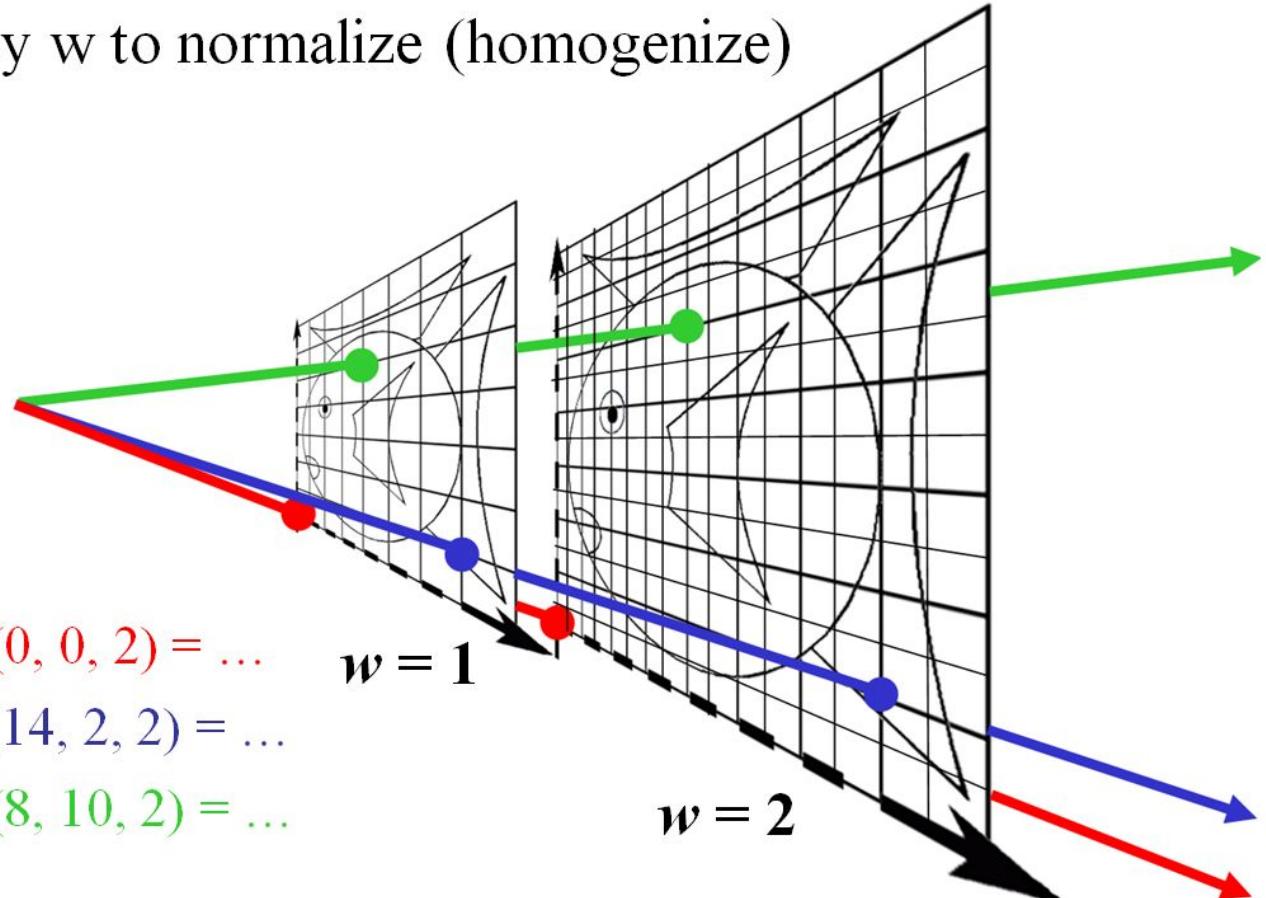

Homogeneous Co-ordinates

- * P_{2d} is a projection of P_h onto the $w = 1$ plane
- * So an infinite number of points correspond to : they constitute the whole line (tx, ty, tw)

Homogeneous Visualization

- Divide by w to normalize (homogenize)
- $W = 0?$

$$(0, 0, 1) = (0, 0, 2) = \dots$$

$$w = 1$$

$$(7, 1, 1) = (14, 2, 2) = \dots$$

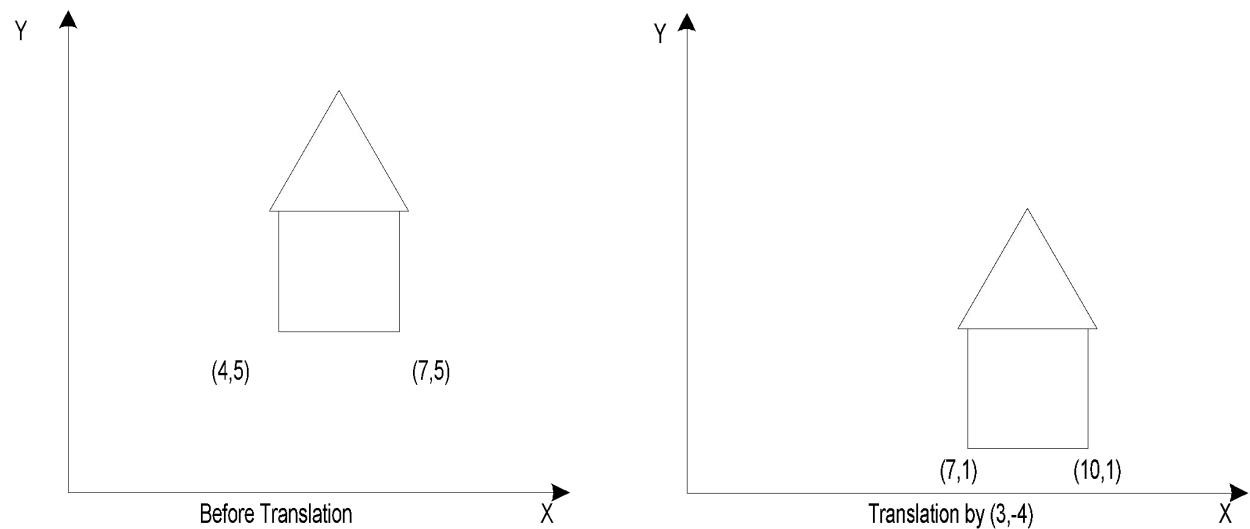

$$(4, 5, 1) = (8, 10, 2) = \dots$$

$$w = 2$$

Mechanics of Rigid Transformations

Translate
Rotate
Scale

Translation – 2D

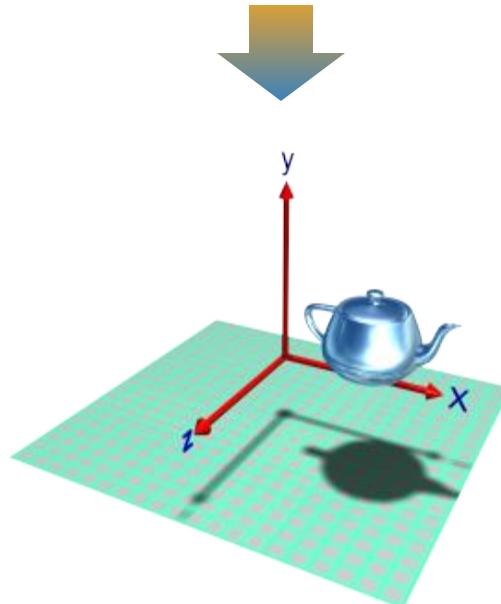

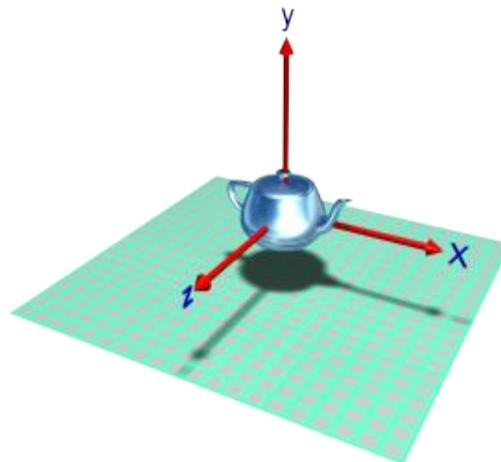

$$x' = x + d_x \quad P = \begin{bmatrix} x \\ y \end{bmatrix} \quad P' = \begin{bmatrix} x' \\ y' \end{bmatrix} \quad T = \begin{bmatrix} d_x \\ d_y \end{bmatrix} \quad P' = P + T$$

Homogeniou s Form

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & d_x \\ 0 & 1 & d_y \\ 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Translation – 3D

$$x' = x + d_x$$

$$y' = y + d_y$$

$$z' = z + d_z$$

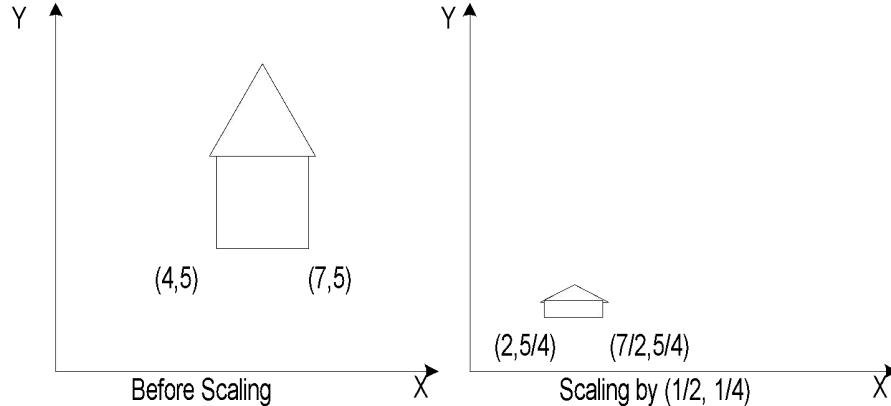

$$\begin{bmatrix} 1 & 0 & 0 & d_x \\ 0 & 1 & 0 & d_y \\ 0 & 0 & 1 & d_z \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x + d_x \\ y + d_y \\ z + d_z \\ 1 \end{bmatrix}$$

$$T(d_x, d_y, d_z) * P = P'$$

Scaling – 2D

$$x' = s_x * x$$

$$y' = s_y * y$$

$$S * P = P'$$

$$\begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix} * \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x * s_x \\ y * s_y \end{bmatrix}$$

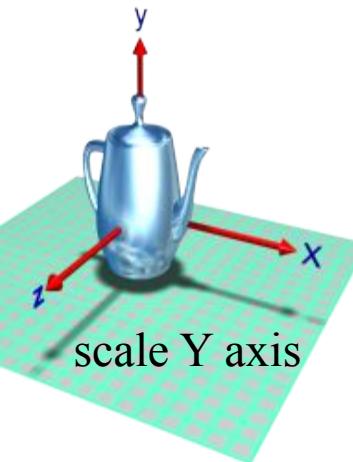

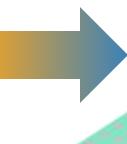

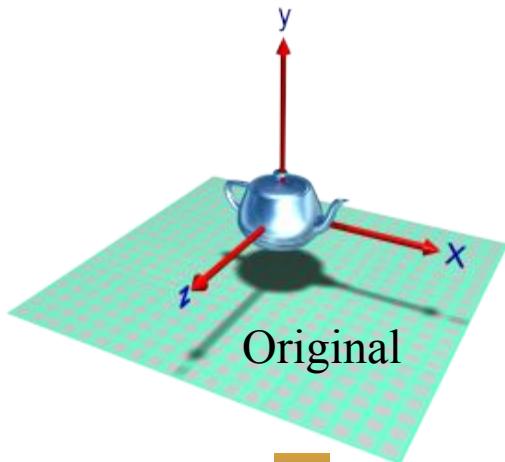

Types of Scaling:

- Differential ($s_x \neq s_y$)
- Uniform ($s_x = s_y$)

Homogenous Form

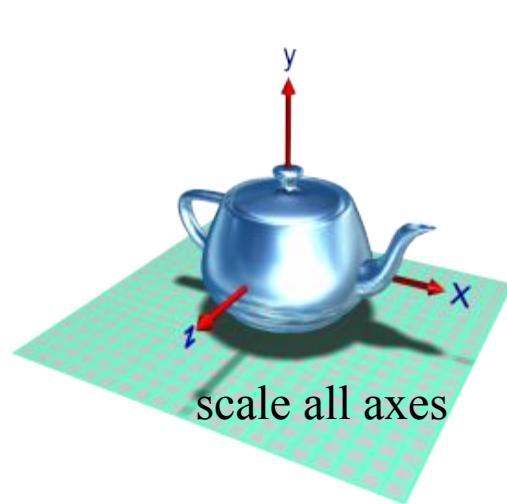

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Scaling – 3D

$$x' = s_x * x$$
$$y' = s_y * y$$
$$z' = s_z * z$$

A blue arrow pointing from the scaled Y-axis state to the scaled all axes state.

$$S(s_x, s_y, s_z) * P = P'$$

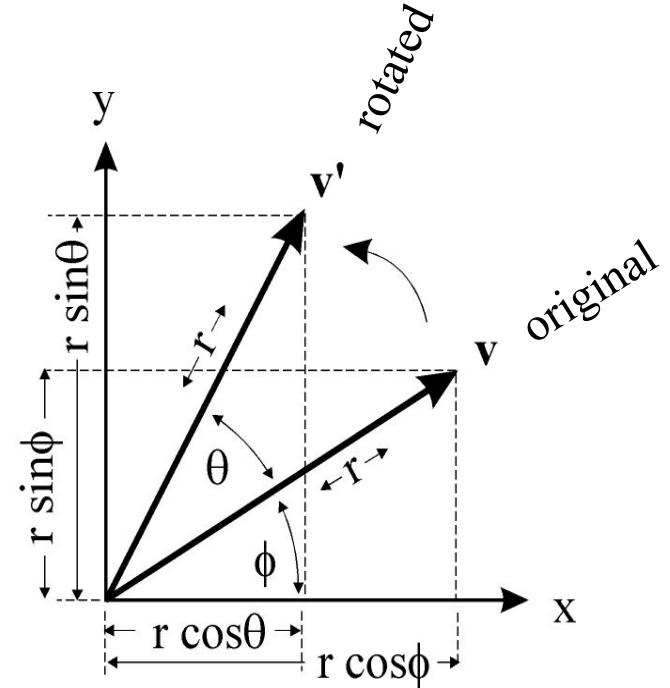

$$\begin{bmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x * s_x \\ y * s_y \\ z * s_z \\ 1 \end{bmatrix}$$

Rotation – 2D

$$\mathbf{v} = \begin{bmatrix} r \cos \phi \\ r \sin \phi \end{bmatrix}$$

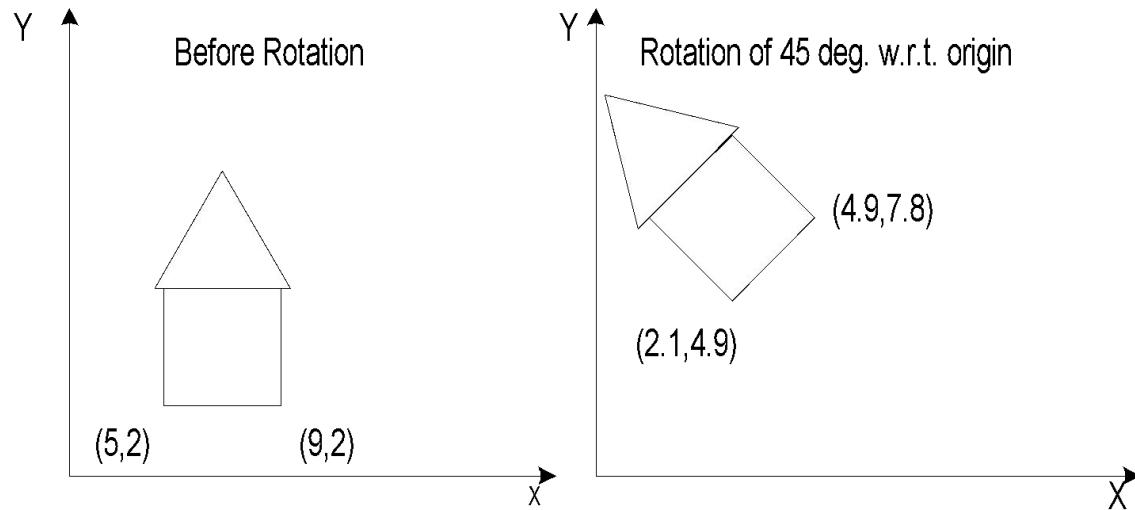

$$\mathbf{v}' = \begin{bmatrix} r \cos(\phi + \theta) \\ r \sin(\phi + \theta) \end{bmatrix}$$

$$\text{expand } (\phi + \theta) \Rightarrow \begin{cases} x' = r \cos \phi \cos \theta - r \sin \phi \sin \theta \\ y' = r \cos \phi \sin \theta + r \sin \phi \cos \theta \end{cases}$$

$$\text{but } \begin{aligned} x &= r \cos \phi & x' &= x \cos \theta - y \sin \theta \\ y &= r \sin \phi & y' &= x \sin \theta + y \cos \theta \end{aligned}$$

Rotation – 2D

$$x * \cos\theta - y * \sin\theta = x'$$

$$x * \sin\theta + y * \cos\theta = y'$$

$$R * P = P'$$

$$\begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix} * \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x * \cos\theta - y * \sin\theta \\ x * \sin\theta + y * \cos\theta \end{bmatrix}$$

Homogenous Form

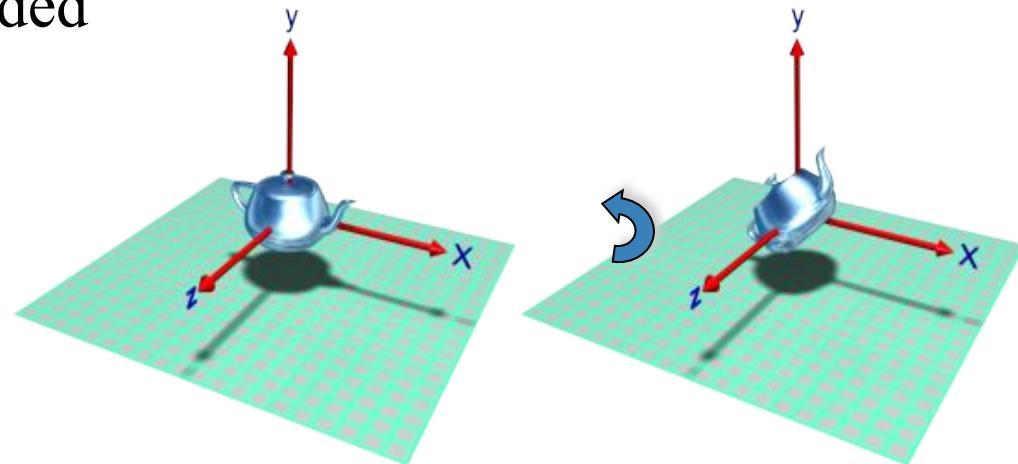

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Rotation – 3D

For 3D-Rotation 2 parameters are needed

- * Angle of rotation
- * Axis of rotation

Rotation about z-axis:

$$R_{\theta,k} \quad * \quad P = P'$$
$$\downarrow \qquad \qquad \qquad \downarrow \qquad \qquad \qquad \downarrow$$
$$\begin{bmatrix} \cos\theta & -\sin\theta & 0 & 0 \\ \sin\theta & \cos\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x * \cos\theta - y * \sin\theta \\ x * \sin\theta + y * \cos\theta \\ z \\ 1 \end{bmatrix}$$

Rotation about Y-axis & X-axis

About y-axis

$$R_{\theta,j}$$

$$* \quad P$$

$$= \quad P'$$

$$\downarrow$$

$$\downarrow$$

$$\downarrow$$

$$\begin{bmatrix} \cos \theta & 0 & \sin \theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin \theta & 0 & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x * \cos \theta + z * \sin \theta \\ y \\ -x * \sin \theta + z * \cos \theta \\ 1 \end{bmatrix}$$

About x-axis

$$R_{\theta,i}$$

$$* \quad P$$

$$= \quad P'$$

$$\downarrow$$

$$\downarrow$$

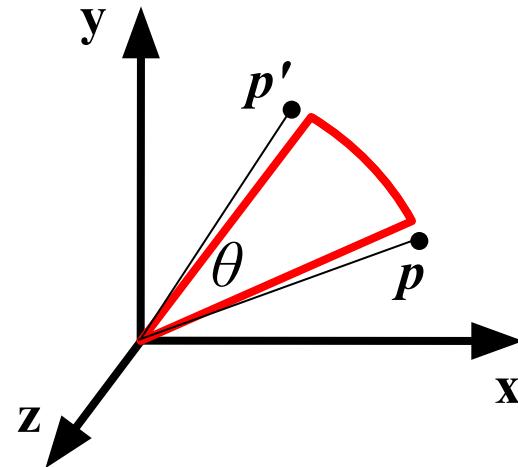

$$\downarrow$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta & 0 \\ 0 & \sin \theta & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y * \cos \theta - z * \sin \theta \\ y * \sin \theta + z * \cos \theta \\ 1 \end{bmatrix}$$

Rotation about Z axis

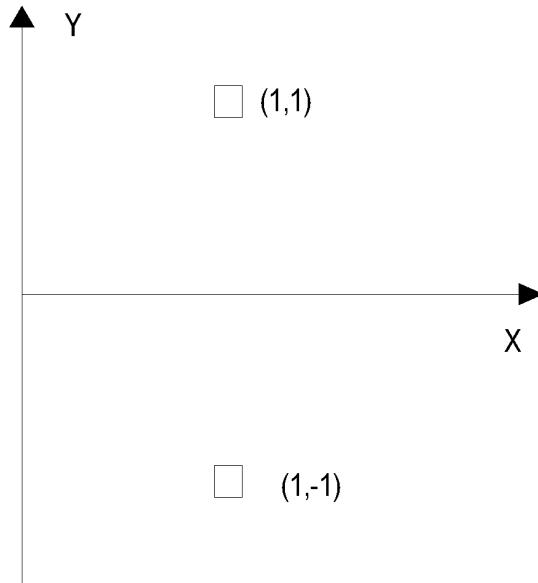

ZRotate(θ)

* About z axis

$$\begin{pmatrix} x' \\ y' \\ z' \\ 1 \end{pmatrix} = \begin{pmatrix} \cos \theta & -\sin \theta & 0 & 0 \\ \sin \theta & \cos \theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}$$

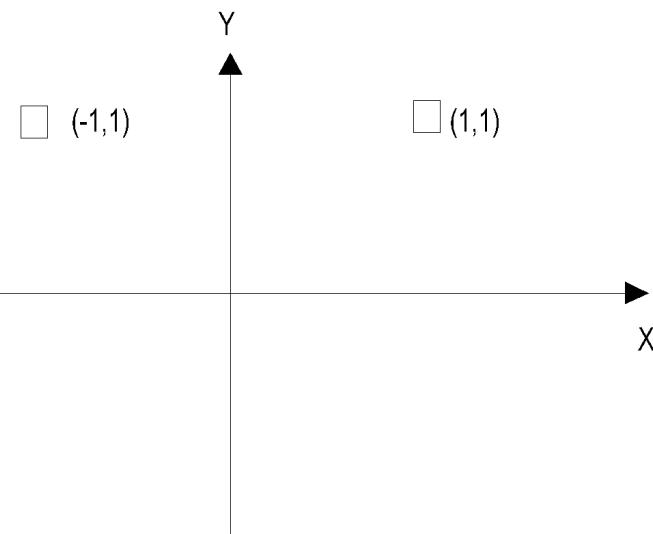

Mirror Reflection

Reflection about X - axis

$$x' = x \quad y' = -y$$

$$M_x = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Reflection about Y - axis

$$x' = -x \quad y' = y$$

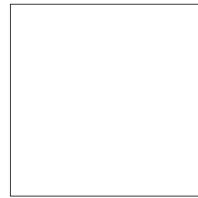

$$M_y = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Shearing Transformation

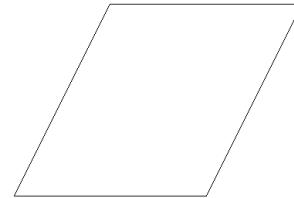

$$SH_x = \begin{bmatrix} 1 & a & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$SH_y = \begin{bmatrix} 1 & 0 & 0 \\ b & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

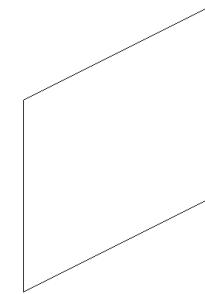

$$SH_{xy} = \begin{bmatrix} 1 & a & 0 \\ b & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

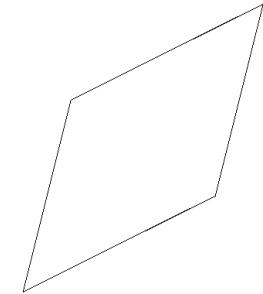

unit cube

Sheared in X
direction

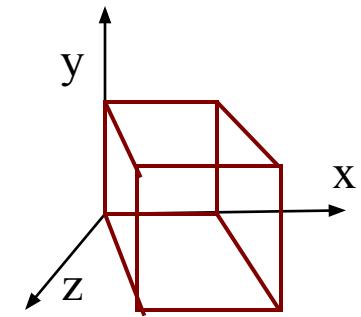

Sheared in Y
direction

Sheared in both X
and Y direction

Shear along Z-axis

$$SH_{xy}(sh_x, sh_y) * P = P'$$

$$\begin{bmatrix} 1 & 0 & sh_x & 0 \\ 0 & 1 & sh_y & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} * \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x + z * sh_x \\ y + z * sh_y \\ z \\ 1 \end{bmatrix}$$

Inverse Transforms

- In general: A^{-1} undoes effect of A
- Special cases:
 - Translation: negate t_x and t_y
 - Rotation: transpose
 - Scale: invert diagonal (axis-aligned scales)
- Others:
 - Invert matrix
 - Invert SVD matrices

Inverse Transformations

Translaiton : $T_{(dx,dy)}^{-1} = T_{(-dx,-dy)}$

Rotation : $R_{(\theta)}^{-1} = R_{(-\theta)} = R_{(\theta)}^T$

Sclaining : $S_{(sx,sy)}^{-1} = S_{(\frac{1}{sx}, \frac{1}{sy})}$

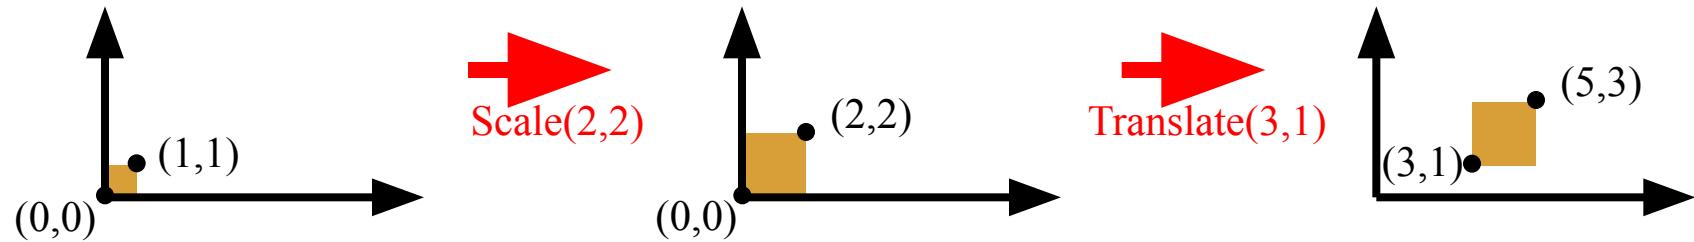

Mirror Ref : $M_x^{-1} = M_x$

$M_y^{-1} = M_y$

Composing Transformations

How are transforms combined?

Scale then Translate

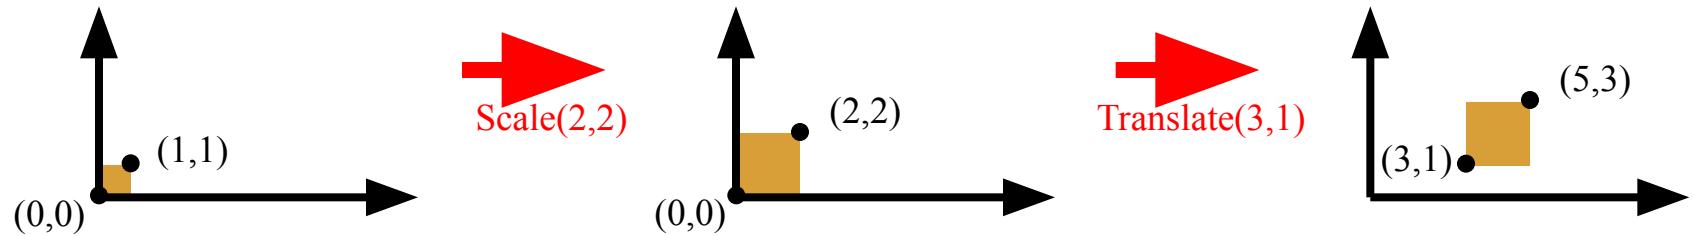

Use matrix multiplication: $p' = T(S p) = TS p$

$$TS = \begin{pmatrix} 1 & 0 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 2 & 0 & 3 \\ 0 & 2 & 1 \\ 0 & 0 & 1 \end{pmatrix}$$

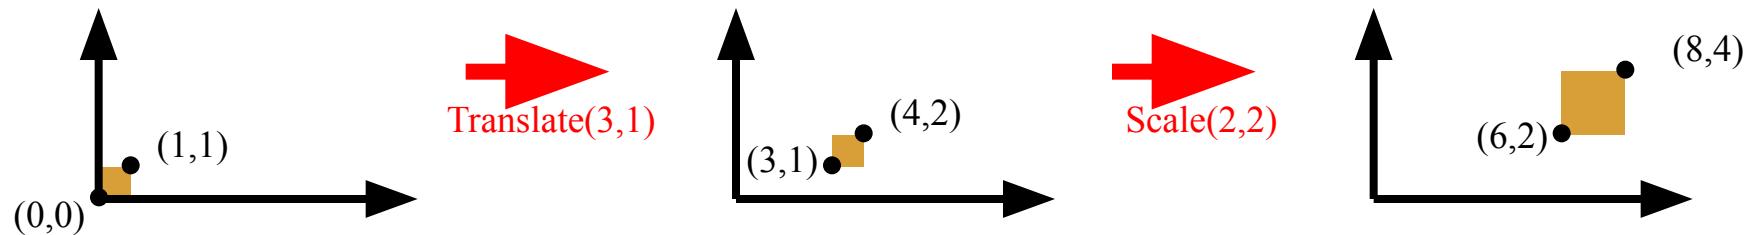

Caution: matrix multiplication is NOT commutative!

Non-commutative Composition

Scale then Translate: $p' = T(S p) = TS p$

Translate then Scale: $p' = S(T p) = ST p$

Non-commutative Composition

Scale then Translate: $p' = T(S p) = TS p$

$$TS = \begin{pmatrix} 1 & 0 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 2 & 0 & 3 \\ 0 & 2 & 1 \\ 0 & 0 & 1 \end{pmatrix}$$

Translate then Scale: $p' = S(T p) = ST p$

$$ST = \begin{pmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 3 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 2 & 0 & 6 \\ 0 & 2 & 2 \\ 0 & 0 & 1 \end{pmatrix}$$

Combining Translations, Rotations

- * Order matters!! TR is not the same as RT (demo)
- * General form for rigid body transforms
- * We show rotation first, then translation (commonly used to position objects) on next slide. Slide after that works it out the other way

Rotate then Translate

$$P' = (TR)P = MP = RP + T$$

$$M = \begin{pmatrix} 1 & 0 & 0 & T_x \\ 0 & 1 & 0 & T_y \\ 0 & 0 & 1 & T_z \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} R_{11} & R_{12} & R_{13} & 0 \\ R_{21} & R_{22} & R_{23} & 0 \\ R_{31} & R_{32} & R_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \left(\begin{array}{ccc|c} R_{11} & R_{12} & R_{13} & T_x \\ R_{21} & R_{22} & R_{23} & T_y \\ R_{31} & R_{32} & R_{33} & T_z \\ \hline 0 & 0 & 0 & 1 \end{array} \right) = \begin{pmatrix} R & T \\ 0 & 1 \end{pmatrix}$$

Translate then Rotate

$$P' = (RT)P = MP = R(P + T) = RP + RT$$

$$M = \begin{pmatrix} R_{11} & R_{12} & R_{13} & 0 \\ R_{21} & R_{22} & R_{23} & 0 \\ R_{31} & R_{32} & R_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 & T_x \\ 0 & 1 & 0 & T_y \\ 0 & 0 & 1 & T_z \\ 0 & 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} R_{3 \times 3} & R_{3 \times 3}T_{3 \times 1} \\ 0_{1 \times 3} & 1 \end{pmatrix}$$

Associativity of Matrix Multiplication

Create new affine transformations by multiplying sequences of the above basic transformations.

$$\mathbf{q} = \mathbf{CBAp}$$

$$\mathbf{q} = ((\mathbf{CB}) \mathbf{A}) \mathbf{p} = (\mathbf{C} (\mathbf{B} \mathbf{A})) \mathbf{p} = \mathbf{C} (\mathbf{B} (\mathbf{A} \mathbf{p})) \text{ etc.}$$

matrix multiplication is associative.

To transform just a point, better to do $\mathbf{q} = \mathbf{C}(\mathbf{B}(\mathbf{A}\mathbf{p}))$

But to transform many points, best to do

$$\mathbf{M} = \mathbf{CBA}$$

then do $\mathbf{q} = \mathbf{Mp}$ for any point \mathbf{p} to be rendered.

For geometric pipeline transformation, define \mathbf{M} and set it up with the model-view matrix and apply it to any vertex subsequently defined to its setting.

Example Composite Transforms

2D Case

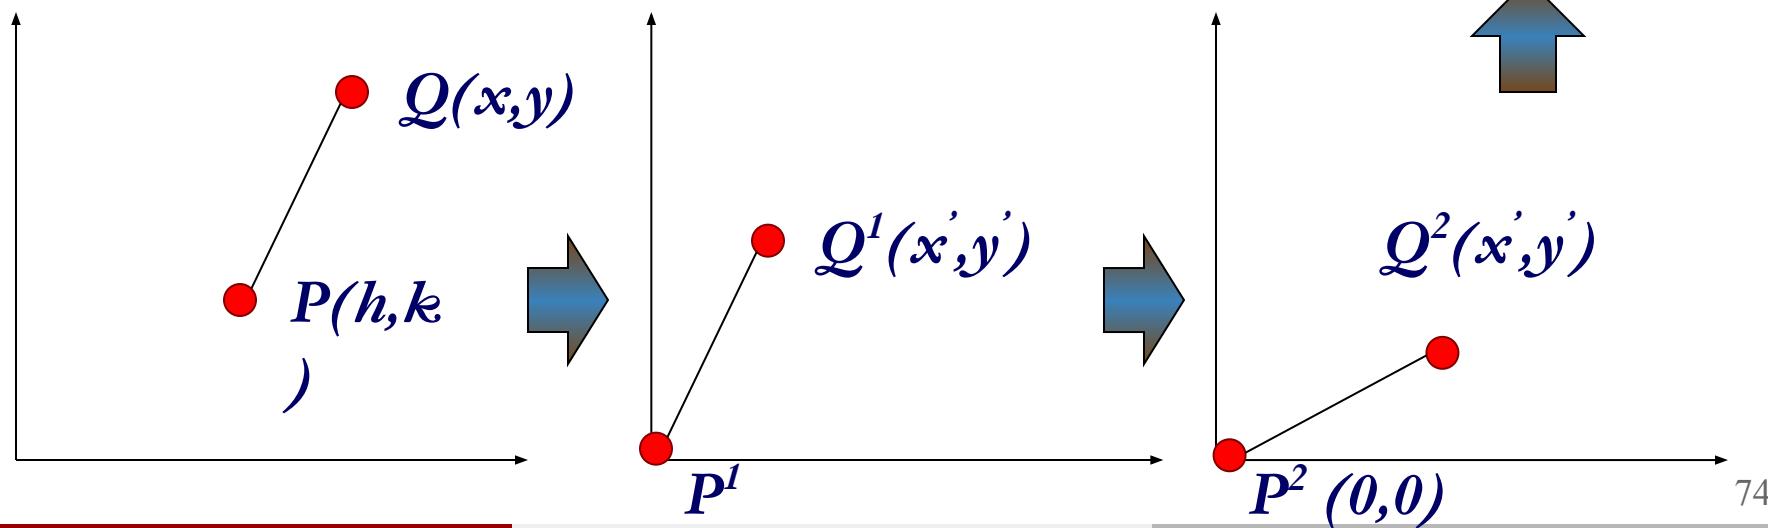

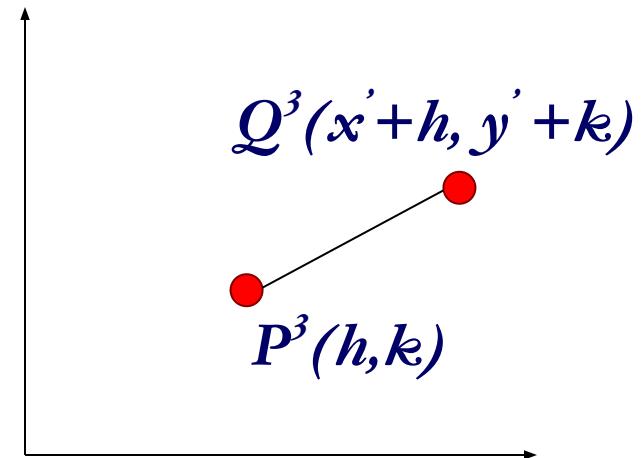

Rotation of θ about $P(h,k)$: $R_{\theta,P}$

Step 1: Translate $P(h,k)$ to origin

Step 2: Rotate θ w.r.t to origin

Step 3: Translate $(0,0)$ to $P(h,k)$

$$R_{\theta,P} = T(h,k) * R_{\theta} * T(-h,-k)$$

Reflection about line L , M_L

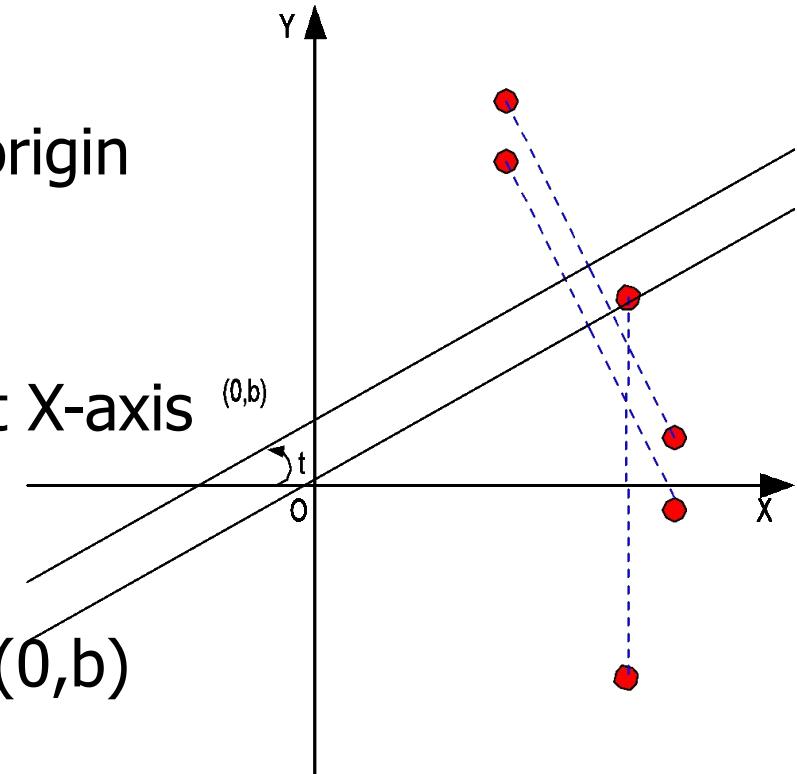

Step 1: Translate $(0,b)$ to origin

Step 2: Rotate $-\theta$ degrees

Step 3: Mirror reflect about X-axis

Step 4: Rotate θ degrees

Step 5: Translate origin to $(0,b)$

$$M_L = T(0, b) * R(\theta) * M_x * R(-\theta) * T(0, -b)$$

Our Friend Rotation with scary formulas

Rotation

- ★ How to rotate around (k_x, k_y, k_z) , a unit vector on an arbitrary axis ...
- ★ Example : Rotate 30 degree around vector $2\mathbf{i}+1\mathbf{j}+3\mathbf{k}$
 - Can it be found from some rotation around x axis, then some rotation around y axis, then z axis ?

Finding the Rotation Matrix

Our previous method

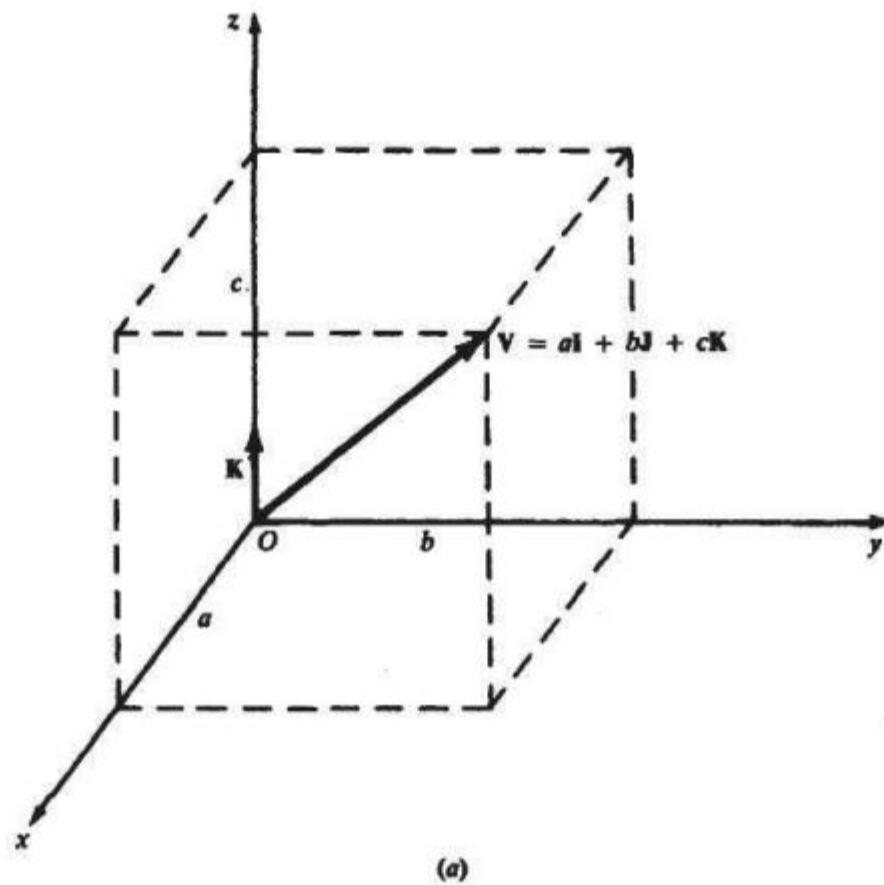

- * **Step 1,2** Perform two rotations so that \mathbf{a} becomes aligned with the z-axis (two rotations are necessary)
- * **Step 3** Do the required θ rotation around z-axis
- * **Step 4,5** Undo the alignment rotations to restore \mathbf{a} to its original direction

Trivial but you should be careful when doing in hands

Step 1,2

- * We now study a composite transformation
- * $A_{V,N}$ = aligning a vector V with a vector N
- * To find the rotation matrix, we need to find

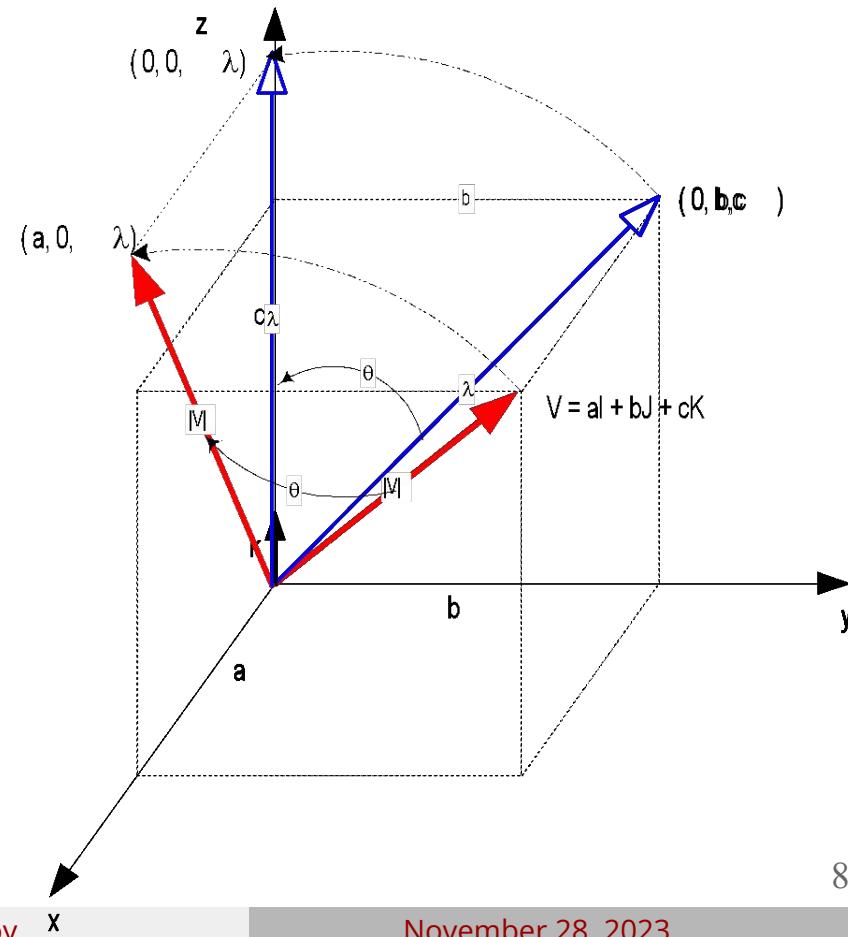

$$A_{v,k}$$

A_V : aligning vector V with k

Step 1 : Rotate about x - axis by θ

$$\left. \begin{array}{l} \sin \theta = \frac{b}{\lambda} \\ \cos \theta = \frac{c}{\lambda} \end{array} \right\} \quad \lambda = \sqrt{b^2 + c^2}$$

$$A_v =$$

$$R_{\theta,i}$$

A_V : aligning vector V with k

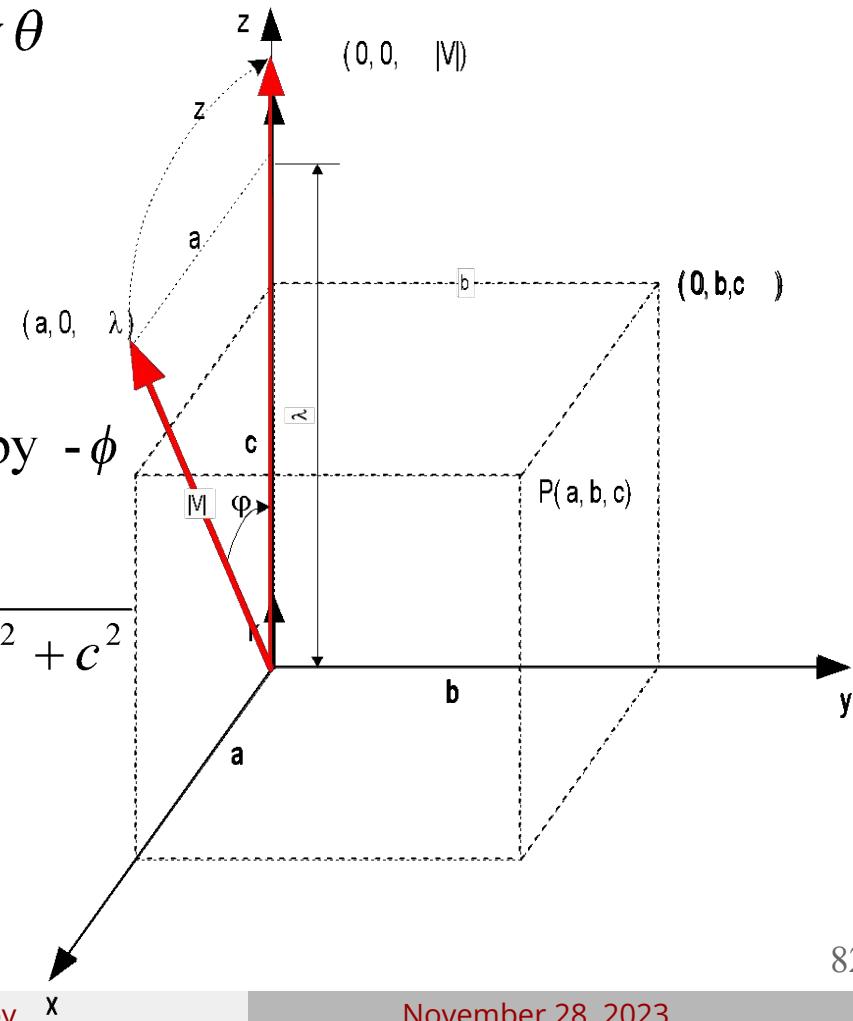

Step 1 : Rotate about x - axis by θ

$$\left. \begin{array}{l} \sin \theta = \frac{b}{\lambda} \\ \cos \theta = \frac{c}{\lambda} \end{array} \right\} \quad \lambda = \sqrt{b^2 + c^2}$$

Step 2 : Rotate V about y - axis by $-\phi$

$$\left. \begin{array}{l} \sin(-\phi) = \frac{-a}{|V|} \\ \cos(-\phi) = \frac{\lambda}{|V|} \end{array} \right\} \quad |V| = \sqrt{a^2 + b^2 + c^2}$$

$$A_V = R_{-\phi,j} * R_{\theta,i}$$

A_V : aligning vector V with k

- * $A_V^{-1} = A_V^T$
- * $A_{V,N} = A_N^{-1} * A_V$

$$A_V = \begin{bmatrix} \frac{\lambda}{|V|} & \frac{-ab}{\lambda|V|} & \frac{-ac}{\lambda|V|} & 0 \\ 0 & \frac{c}{\lambda} & \frac{-b}{\lambda} & 0 \\ \frac{a}{|V|} & \frac{b}{|V|} & \frac{c}{|V|} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Finding the rotation matrix

- * Now we have done step 1,2 : A_v
- * For step 3, we have to rotate theta angle around z axis
- * Then take the inverse of step 1,2,

$$A_v^{-1} = A_v^T$$

$$R = A_v^T R_z(\theta) A_v$$

- * There are actually 5 rotations here. None of which are Euler angles α or β or γ

Rodrigues Formula

Axis Angle Notation

There is another way that is both easier to understand and provides you with more insights into what rotation is really about. Instead of specifying a rotation by a series of canonical angles, we will specify an arbitrary axis of rotation and an angle. We will also first consider rotating vectors, and come back to points shortly.

$$\begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \left(\text{Symmetric} \begin{bmatrix} a_x \\ a_y \\ a_z \end{bmatrix} (1 - \cos \theta) + \text{Skew} \begin{bmatrix} a_x \\ a_y \\ a_z \end{bmatrix} \sin \theta + \mathbf{I} \cos \theta \right) \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$

The vector a specifies the axis of rotation. *This axis vector must be normalized.* The rotation angle is given by θ .

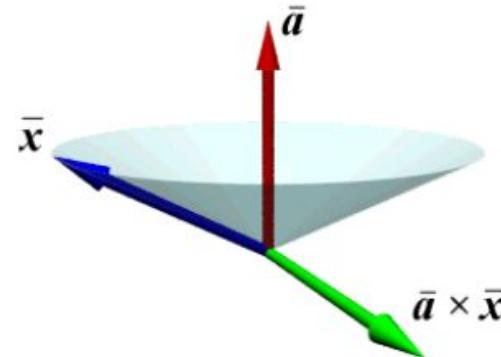

You might ask "How am I going to remember **this** equation?". However, once you understand the geometry of rotation, the equation will seem obvious.

The basic idea is that *any rotation can be decomposed into weighted contributions from three different vectors.*

$$R(a, \theta) = \cos \theta \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + (1 - \cos \theta) \begin{pmatrix} a_x^2 & a_x a_y & a_x a_z \\ a_x a_y & a_y^2 & a_y a_z \\ a_x a_z & a_y a_z & a_z^2 \end{pmatrix} + \sin \theta \begin{pmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{pmatrix}$$

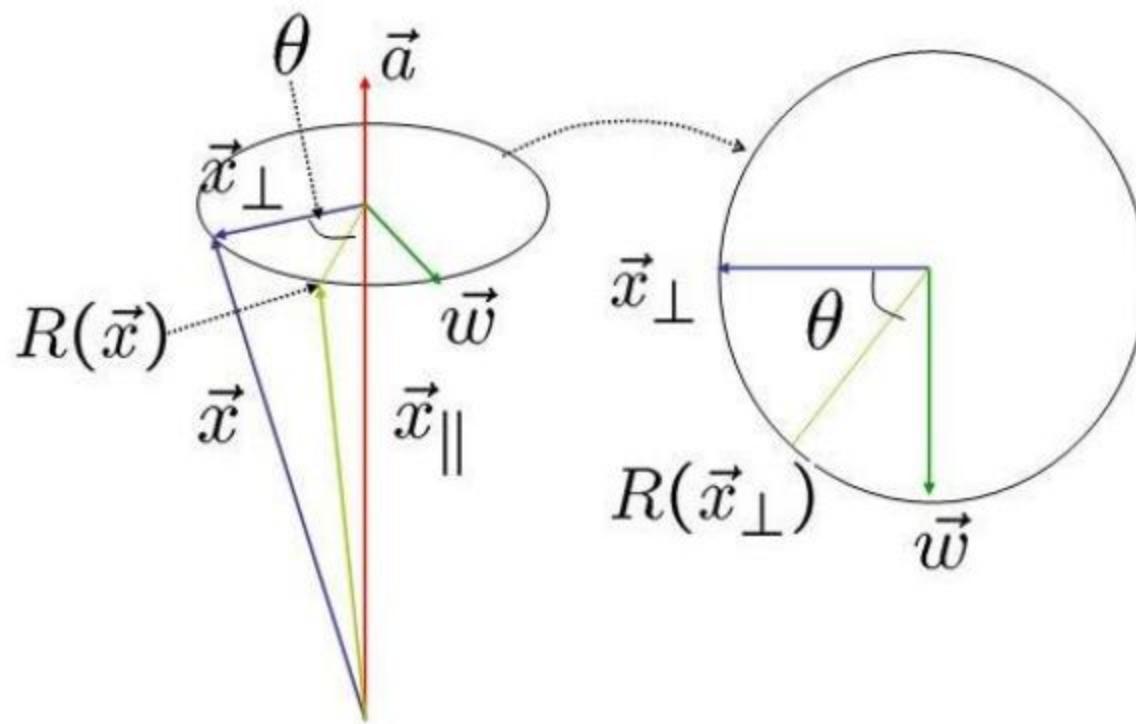

The Geometry of a Rotation

We can actually define a *natural* basis for rotation in terms of three defining vectors. These vectors are the rotation axis, a vector perpendicular to both the rotation axis and the vector being rotated, and the vector itself. These vectors correspond to the each respective term in the expression.

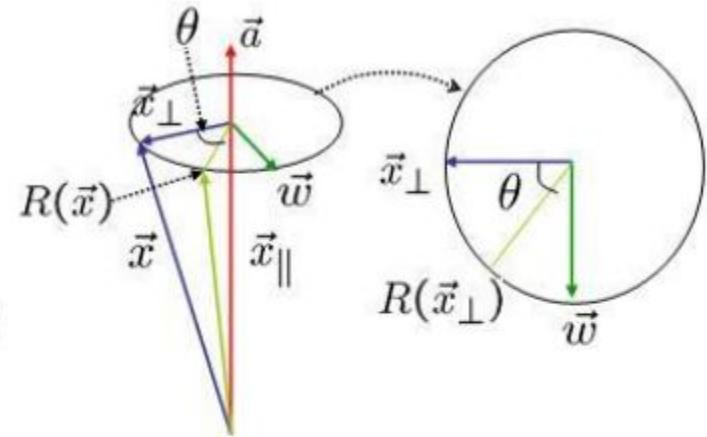

Let's look at this in greater detail

The Geometry of a Rotation

The Geometry of Rotation

$$\begin{aligned}
 \vec{w} &= \vec{a} \times \vec{x}_\perp \\
 &= \vec{a} \times (\vec{x} - \vec{x}_\parallel) \\
 &= (\vec{a} \times \vec{x}) - (\vec{a} \times \vec{x}_\parallel) \\
 &= \vec{a} \times \vec{x}
 \end{aligned}$$

$$R(\vec{x}_\perp) = \cos \theta \vec{x}_\perp + \sin \theta \vec{w}$$

$$\vec{x}_\parallel = (\vec{a} \cdot \vec{x}) \vec{a}$$

$$\vec{x}_\perp = \vec{x} - \vec{x}_\parallel = \vec{x} - (\vec{a} \cdot \vec{x}) \vec{a}$$

$$\begin{aligned}
 R(\vec{x}) &= R(\vec{x}_\parallel) + R(\vec{x}_\perp) \\
 &= R(\vec{x}_\parallel) + \cos \theta \vec{x}_\perp + \sin \theta \vec{w} \\
 &= (\vec{a} \cdot \vec{x}) \vec{a} + \cos \theta (\vec{x} - (\vec{a} \cdot \vec{x}) \vec{a}) + \sin \theta \vec{w} \\
 &= \cos \theta \vec{x} + (1 - \cos \theta)(\vec{a} \cdot \vec{x}) \vec{a} + \sin \theta (\vec{a} \times \vec{x})
 \end{aligned}$$

The Geometry of Rotation

- * So we find, the rotation vector is :

Vector Form

$$R(\vec{x}) = \cos \theta \vec{x} + (1 - \cos \theta)(\vec{a} \cdot \vec{x})\vec{a} + \sin \theta(\vec{a} \times \vec{x})$$

- * This is a vector equation, which is good
- * But, we need a matrix form also, to work easily.

Rodrigue
s
Formula

$$R(k, \theta) = \cos \theta \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + (1 - \cos \theta) \begin{pmatrix} a_x^2 & a_x a_y & a_x a_z \\ a_x a_y & a_y^2 & a_y a_z \\ a_x a_z & a_y a_z & a_z^2 \end{pmatrix} + \sin \theta \begin{pmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{pmatrix}$$

Matrix Form

Rodrigues Formula

* Vector and Matrix forms

$$R(\vec{x}) = \cos \theta \vec{x} + (1 - \cos \theta)(\vec{a} \cdot \vec{x})\vec{a} + \sin \theta (\vec{a} \times \vec{x})$$

$$X = [x \ y \ z]^T$$

$$R(x) = R(k, \theta)X$$

$$R(k, \theta) = \cos \theta \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + (1 - \cos \theta) \begin{pmatrix} a_x^2 & a_x a_y & a_x a_z \\ a_x a_y & a_y^2 & a_y a_z \\ a_x a_z & a_y a_z & a_z^2 \end{pmatrix} + \sin \theta \begin{pmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{pmatrix}$$

- * How we find these equivalent matrix and vector forms ?
- * Check next slide

Vector and Matrix algebra

You've probably been exposed to vector algebra in previous courses. These include *vector addition*, the *vector dot product*, and the *vector cross product*. Let's take a minute to discuss an equivalent set of matrix operators.

We begin with the *dot product*. This operation acts on two vectors and returns a scalar. Geometrically, this operation can be described as a projection of one vector onto another. The dot product has the following matrix formulation.

$$\vec{a} \cdot \vec{b} = \begin{bmatrix} a_x & a_y & a_z \end{bmatrix} \begin{bmatrix} b_x \\ b_y \\ b_z \end{bmatrix} = \alpha$$

Cross product in Matrix Form

The vector cross product also acts on two vectors and returns a third vector. Geometrically, this new vector is constructed such that its projection onto either of the two input vectors is zero.

$$\vec{a} \times \vec{b} = \begin{bmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{bmatrix} \begin{bmatrix} b_x \\ b_y \\ b_z \end{bmatrix} = \vec{c} \quad \vec{a} \cdot \vec{c} = 0 \quad \vec{b} \cdot \vec{c} = 0$$

In order for one vector to project onto another with a length of zero, it must either have a length of zero, or be *perpendicular* to the second vector. Yet the vector generated by the cross-product operator is perpendicular to two vectors. Since the two input vectors define a plane in space, the vector that results from the cross product operation is perpendicular, or *normal* to this plane.

For any plane there are two possible choices of a normal vector, one on each side of a plane. The cross product is defined to be the one of these two vectors where the motion from the tip of the first input vector to the tip of the second input vector is in a counter-clockwise direction when observed from the side of the normal. This is just a restatement of the right-hand rule that you are familiar with.

Finding rotations from a rotation matrix

- * Given, R is a pure rotation matrix
- * Find **axis of rotation $K(k_x, k_y, k_z)$ and angle theta from R**
- * Recall rodriques formula, it gives R
- * Check that : $\cos\theta = \frac{\text{Trace}(R) - 1}{2}$
- * $\text{Trace}(R) = \text{Sum of diagonal elements of the } 3 \times 3 \text{ rotation matrix}$

$$R = \begin{pmatrix} k_xk_x(1-c)+c & k_yk_x(1-c)-k_zs & k_xk_z(1-c)+k_ys & 0 \\ k_yk_x(1-c)+k_zs & k_yk_y(1-c)+c & k_yk_z(1-c)-k_xs & 0 \\ k_zk_x(1-c)-k_ys & k_zk_y(1-c)+k_xs & k_zk_z(1-c)+c & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

Finding rotations from a rotation matrix

* Check that :

$$\begin{bmatrix} 0 & -k_z & k_y \\ k_z & 0 & -k_x \\ -k_y & k_x & 0 \end{bmatrix} = \frac{1}{2 \sin(\theta)} (R - R^T) \quad \longrightarrow \quad k_x = \frac{1}{2 \sin(\theta)} (R_{3,2} - R_{2,3})$$

$$k_y = \frac{1}{2 \sin(\theta)} (R_{1,3} - R_{3,1})$$

$$k_z = \frac{1}{2 \sin(\theta)} (R_{2,1} - R_{1,2})$$

$$R = \begin{pmatrix} k_x k_x (1-c) + c & k_y k_x (1-c) - k_z s & k_x k_z (1-c) + k_y s & 0 \\ k_y k_x (1-c) + k_z s & k_y k_y (1-c) + c & k_y k_z (1-c) - k_x s & 0 \\ k_z k_x (1-c) - k_y s & k_z k_y (1-c) + k_x s & k_z k_z (1-c) + c & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

Properties of rotation matrix

- ★ The columns of rotation matrix are unit vectors perpendicular to each other
- ★ The column vectors indicate where the unit vectors along the principal axes are transformed
- ★ The rows of rotation matrix are unit vectors perpendicular to each other
- ★ The row vectors indicate the vectors that are transformed into the unit vectors along the principal axes
- ★ The inverse of rotation matrix is its transpose
